

High-side driver with CurrentSense analog feedback for automotive applications

Datasheet - production data

Features

Max transient supply voltage	V _{CC}	40 V
Operating voltage range	V _{CC}	4 to 28 V
Typ. on-state resistance (per Ch)	R _{ON}	8.5 mΩ
Current limitation (typ)	I _{LIMH}	96 A
Standby current (max)	I _{STBY}	0.5 μA

- Automotive qualified
- General
 - Single channel smart high side driver with CS analog feedback
 - Very low standby current
 - Compatible with 3 V and 5 V CMOS outputs
- CS diagnostic functions
 - Analog feedback of: load current with high precision proportional current mirror
 - Overload and short to ground (power limitation) indication
 - Thermal shutdown indication
 - OFF-state open-load detection
 - Output short to V_{CC} detection
 - Sense enable/ disable
- Protections
 - Undervoltage shutdown
 - Overvoltage clamp

- Load current limitation
- Self limiting of fast thermal transients
- Configurable latch-off on overtemperature or power limitation with dedicated fault reset pin
- Loss of ground and loss of V_{CC}
- Reverse battery with external components
- Electrostatic discharge protection

Applications

- All types of Automotive resistive, inductive and capacitive loads
- Specially intended for Automotive Headlamps

Description

The device is a single channel high-side driver manufactured using ST proprietary VIPower[®] technology and housed in PowerSSO-16 package. The device is designed to drive 12 V automotive grounded loads through a 3 V and 5 V CMOS-compatible interface, and to provide protection and diagnostics.

The device integrates advanced protective functions such as load current limitation, overload active management by power limitation and overtemperature shutdown with configurable latch-off.

A FaultRST pin unlatches the output in case of fault or disables the latch-off functionality.

A sense enable pin allows OFF-state diagnosis to be disabled during the module low-power mode as well as external sense resistor sharing among similar devices.

1 Block diagram and pin description

Figure 1: Block diagram

Table 1: Pin functions

Name	Function
V _{CC}	Battery connection.
OUTPUT	Power outputs. All the pins must be connected together.
GND	Ground connection. Must be reverse battery protected by an external diode / resistor network.
INPUT	Voltage controlled input pin with hysteresis, compatible with 3 V and 5 V CMOS outputs. It controls output switch state.
CS	Analog current sense output pin delivers a current proportional to the load current.
SEn	Active high compatible with 3 V and 5 V CMOS outputs pin; it enables the CS diagnostic pin.
FaultRST	Active low compatible with 3 V and 5 V CMOS outputs pin; it unlatches the output in case of fault; If kept low, sets the outputs in auto-restart mode.

Figure 2: Configuration diagram (top view)

Pins 9, 10, 11 and 12 are internally connected; Pins 13, 14, 15 and 16 are internally connected; All output pins must be connected together on PCB.

Table 2: Suggested connections for unused and not connected pins

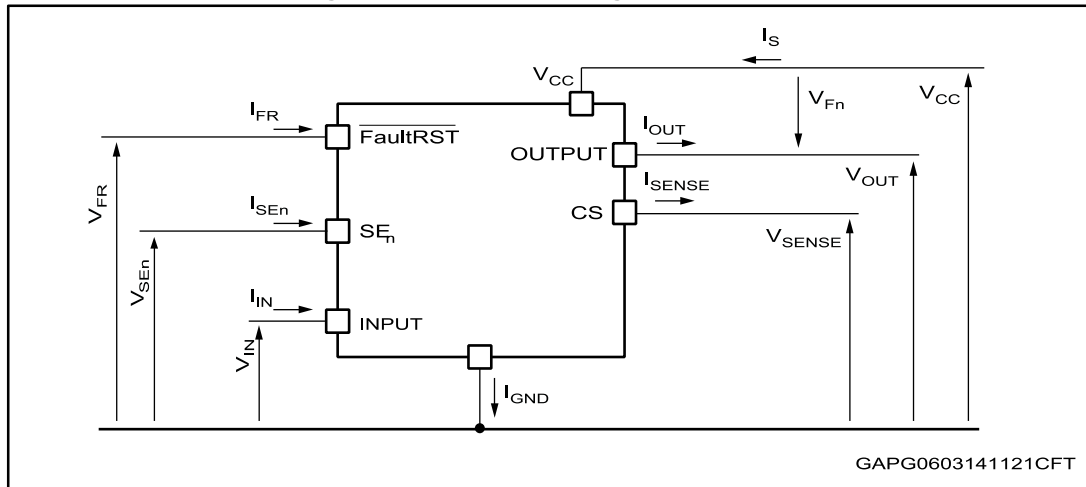

Connection / pin	CS	N.C.	Output	Input	SEn, FaultRST
Floating	Not allowed	X ⁽¹⁾	X	X	X
To ground	Through 1 kΩ resistor	X	Not allowed	Through 15 kΩ resistor	Through 15 kΩ resistor

Notes:

⁽¹⁾X: do not care.

2 Electrical specification

Figure 3: Current and voltage conventions

$V_F = V_{OUT} - V_{CC}$ during reverse battery condition.

2.1 Absolute maximum ratings

Stressing the device above the rating listed in [Table 3: "Absolute maximum ratings"](#) may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to the conditions in table below for extended periods may affect device reliability.

Table 3: Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{CC}	DC supply voltage	38	V
$-V_{CC}$	Reverse DC supply voltage	0.3	
V_{CCPK}	Maximum transient supply voltage (ISO 16750-2:2010 Test B clamped to 40V; $R_L = 4 \Omega$)	40	
V_{CCJS}	Maximum jump start voltage for single pulse short circuit protection	28	
$-I_{GND}$	DC reverse ground pin current	200	mA
I_{OUT}	OUTPUT DC output current	Internally limited	A
$-I_{OUT}$	Reverse DC output current	35	
I_{IN}	INPUT DC input current	-1 to 10	mA
I_{SEn}	SEn DC input current		
I_{FR}	FaultRST DC input current		
V_{FR}	FaultRST DC input voltage	7.5	V
I_{SENSE}	CS pin DC output current ($V_{GND} = V_{CC}$ and $V_{SENSE} < 0 V$)	10	mA
	CS pin DC output current in reverse ($V_{CC} < 0V$)	-20	

Symbol	Parameter	Value	Unit
E_{MAX}	Maximum switching energy (single pulse) ($T_{DEMAG} = 0.4 \text{ ms}$; $T_{jstart} = 150 \text{ °C}$)	170	mJ
V_{ESD}	Electrostatic discharge (JEDEC 22A-114F)		
	• INPUT	4000	V
	• CS	2000	V
	• SEn, FaultRST	4000	V
	• OUTPUT	4000	V
	• V_{CC}	4000	V
V_{ESD}	Charge device model (CDM-AEC-Q100-011)	750	V
T_j	Junction operating temperature	-40 to 150	°C
T_{stg}	Storage temperature	-55 to 150	

2.2 Thermal data

Table 4: Thermal data

Symbol	Parameter	Typ. value	Unit
$R_{thj-board}$	Thermal resistance junction-board (JEDEC JESD 51-5 / 51-8) ⁽¹⁾	3.85	°C/W
$R_{thj-amb}$	Thermal resistance junction-ambient (JEDEC JESD 51-5) ⁽²⁾	54.8	
$R_{thj-amb}$	Thermal resistance junction-ambient (JEDEC JESD 51-7) ⁽¹⁾	21	

Notes:

⁽¹⁾Device mounted on four-layers 2s2p PCB.

⁽²⁾Device mounted on two-layers 2s0p PCB with 2 cm² heatsink copper trace.

2.3 Main electrical characteristics

$7 \text{ V} < V_{CC} < 18 \text{ V}$; $-40 \text{ °C} < T_j < 150 \text{ °C}$, unless otherwise specified.

All typical values refer to $V_{CC} = 13 \text{ V}$; $T_j = 25 \text{ °C}$, unless otherwise specified.

Table 5: Power section

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
V_{CC}	Operating supply voltage		4	13	28	V
V_{USD}	Undervoltage shutdown				4	
$V_{USDReset}$	Undervoltage shutdown reset				5	
$V_{USDhyst}$	Undervoltage shutdown hysteresis			0.3		
R_{ON}	On-state resistance	$I_{OUT} = 5 \text{ A}$; $T_j = 25 \text{ °C}$		8.5		mΩ
		$I_{OUT} = 5 \text{ A}$; $T_j = 150 \text{ °C}$			17	
		$I_{OUT} = 5 \text{ A}$; $V_{CC} = 4 \text{ V}$; $T_j = 25 \text{ °C}$			12.75	
V_{clamp}	Clamp voltage	$I_s = 20 \text{ mA}$; $T_j = -40 \text{ °C}$	38			V
		$I_s = 20 \text{ mA}$; $25 \text{ °C} < T_j < 150 \text{ °C}$	41	46	52	

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
I _{STBY}	Supply current in standby at V _{CC} = 13 V ⁽¹⁾	V _{CC} = 13 V; V _{IN} = V _{OUT} = V _{FR} = V _{SEn} = 0 V; T _j = 25 °C			0.5	μA
		V _{CC} = 13 V; V _{IN} = V _{OUT} = V _{FR} = V _{SEn} = 0 V; T _j = 85 °C ⁽²⁾			0.5	μA
		V _{CC} = 13 V; V _{IN} = V _{OUT} = V _{FR} = V _{SEn} = 0 V; T _j = 125 °C			3	μA
t _{D_STBY}	Standby mode blanking time	V _{CC} = 13 V; V _{IN} = 5 V; V _{SEn} = V _{FR} = 0 V; I _{OUT} = 0 A	60	300	550	μs
I _{S(ON)}	Supply current	V _{CC} = 13 V; V _{SEn} = V _{FR} = 0 V; V _{IN} = 5 V; I _{OUT} = 0 A		3	5	mA
I _{GND(ON)}	Control stage current consumption in ON state. All channels active.	V _{CC} = 13 V; V _{SEn} = 5 V; V _{FR} = 0 V; V _{IN} = 5 V; I _{OUT} = 5 A			6	mA
I _{L(off)}	Off-state output current at V _{CC} = 13 V	V _{IN} = V _{OUT} = 0 V; V _{CC} = 13 V; T _j = 25 °C	0	0.01	0.5	μA
		V _{IN} = V _{OUT} = 0 V; V _{CC} = 13 V; T _j = 125 °C	0		3	
V _F	Output - V _{CC} diode voltage	I _{OUT} = -5 A; T _j = 150 °C			0.7	V

Notes:

(1)PowerMOS leakage included.

(2)Parameter specified by design; not subject to production test.

Table 6: Switching

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
V_{CC} = 13 V; -40°C < T_j < 150°C, unless otherwise specified						
t _{d(on)} ⁽¹⁾	Turn-on delay time at T _j = 25°C	R _L = 2.6 Ω	10	45	120	μs
t _{d(off)} ⁽¹⁾	Turn-off delay time at T _j = 25°C		10	48	100	
(dV _{OUT} /dt) _{on} ⁽¹⁾	Turn-on voltage slope at T _j = 25°C	R _L = 2.6 Ω	0.1	0.2	0.7	V/μs
(dV _{OUT} /dt) _{off} ⁽¹⁾	Turn-off voltage slope at T _j = 25°C		0.1	0.3	0.7	
W _{ON}	Switching energy losses at turn-on (t _{won})	R _L = 2.6 Ω	—	0.8	1.2 ⁽²⁾	mJ
W _{OFF}	Switching energy losses at turn-off (t _{woff})	R _L = 2.6 Ω	—	0.6	1 ⁽²⁾	mJ
t _{SKEW} ⁽¹⁾	Differential Pulse skew (t _{PHL} - t _{PLH})	R _L = 2.6 Ω	-65	-15	35	μs

Notes:(1)See [Figure 6: "Switching times and Pulse skew"](#).

(2)Parameter guaranteed by design and characterization; not subject to production test.

Table 7: Logic Inputs

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit

3 Protections

3.1 Power limitation

The basic working principle of this protection consists of an indirect measurement of the junction temperature swing ΔT_j through the direct measurement of the spatial temperature gradient on the device surface in order to automatically shut off the output MOSFET as soon as ΔT_j exceeds the safety level of ΔT_{j_SD} . According to the voltage level on the FaultRST pin, the output MOSFET switches on and cycles with a thermal hysteresis according to the maximum instantaneous power which can be handled (FaultRST = Low) or remains off (FaultRST = High). The protection prevents fast thermal transient effects and, consequently, reduces thermo-mechanical fatigue.

3.2 Thermal shutdown

In case the junction temperature of the device exceeds the maximum allowed threshold (typically 175°C), it automatically switches off and the diagnostic indication is triggered. According to the voltage level on the FaultRST pin, the device switches on again as soon as its junction temperature drops to T_R (FaultRST = Low) or remains off (FaultRST = High).

3.3 Current limitation

The device is equipped with an output current limiter in order to protect the silicon as well as the other components of the system (e.g. bonding wires, wiring harness, connectors, loads, etc.) from excessive current flow. Consequently, in case of short circuit, overload or during load power-up, the output current is clamped to a safety level, I_{LIMH} , by operating the output power MOSFET in the active region.

3.4 Negative voltage clamp

In case the device drives inductive load, the output voltage reaches a negative value during turn off. A negative voltage clamp structure limits the maximum negative voltage to a certain value, V_{DEMAG} , allowing the inductor energy to be dissipated without damaging the device.

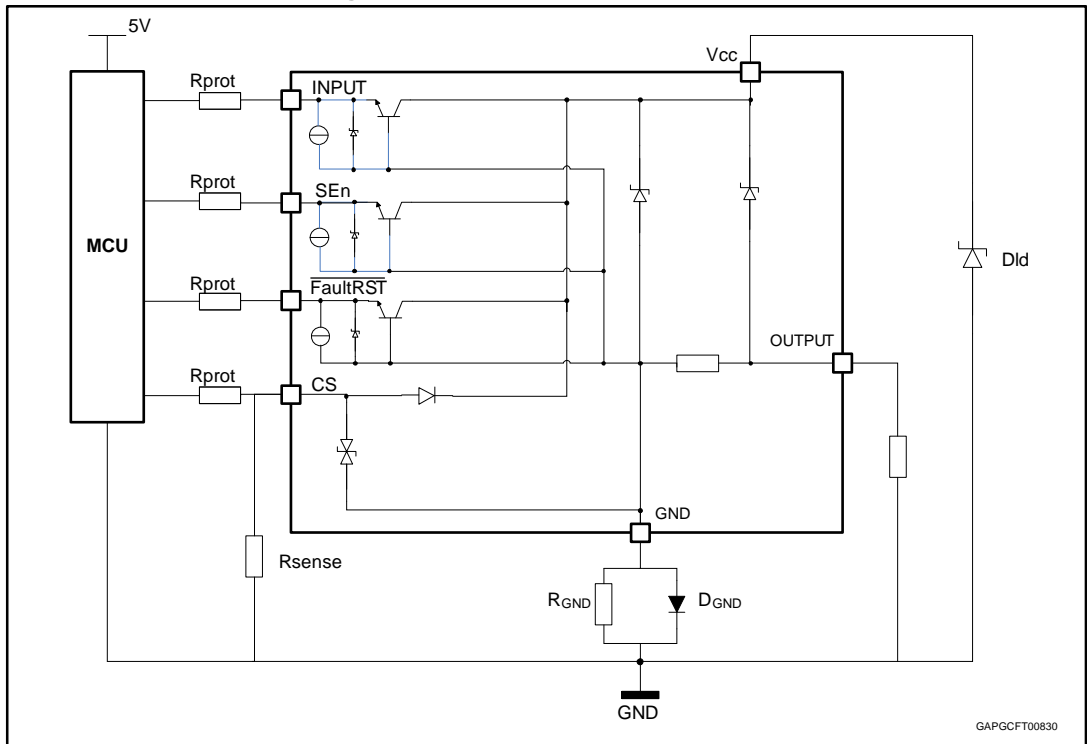

4 Application information

Figure 34: Application diagram

4.1 GND protection network against reverse battery

Figure 35: Simplified internal structure

4.1.1 Diode (DGND) in the ground line

A resistor (typ. $R_{GND} = 4.7 \text{ k}\Omega$) should be inserted in parallel to D_{GND} if the device drives an inductive load.

This small signal diode can be safely shared amongst several different HSDs. Also in this case, the presence of the ground network produces a shift ($\approx 600 \text{ mV}$) in the input threshold and in the status output values if the microprocessor ground is not common to the device ground. This shift does not vary if more than one HSD shares the same diode/resistor network.

4.2 Immunity against transient electrical disturbances

The immunity of the device against transient electrical emissions, conducted along the supply lines and injected into the V_{CC} pin, is tested in accordance with ISO 7637-2:2011 (E) and ISO 16750-2:2010.

The related function performance status classification is shown in [Table 12: "ISO 7637-2 - electrical transient conduction along supply line"](#).

Test pulses are applied directly to DUT (Device Under Test) both in ON and OFF-state and in accordance to ISO 7637-2:2011(E), chapter 4. The DUT is intended as the present device only, without components and accessed through V_{CC} and GND terminals.

Status II is defined in ISO 7637-1 Function Performance Status Classification (FPSC) as follows: "The function does not perform as designed during the test but returns automatically to normal operation after the test".

Table 12: ISO 7637-2 - electrical transient conduction along supply line

Test Pulse 2011(E)	Test pulse severity level with Status II functional performance status		Minimum number of pulses or test time	Burst cycle / pulse repetition time		Pulse duration and pulse generator internal impedance
	Level	$U_S^{(1)}$		min	max	
1	III	-112V	500 pulses	0,5 s		2ms, 10 Ω
2a	III	+55V	500 pulses	0,2 s	5 s	50 μ s, 2 Ω
3a	IV	-220V	1h	90 ms	100 ms	0.1 μ s, 50 Ω
3b	IV	+150V	1h	90 ms	100 ms	0.1 μ s, 50 Ω
4 ⁽²⁾	IV	-7V	1 pulse			100ms, 0.01 Ω
Load dump according to ISO 16750-2:2010						
Test B ⁽³⁾		40V	5 pulse	1 min		400ms, 2 Ω

Notes:

⁽¹⁾ U_S is the peak amplitude as defined for each test pulse in ISO 7637-2:2011(E), chapter 5.6.

⁽²⁾Test pulse from ISO 7637-2:2004(E).

⁽³⁾With 40 V external suppressor referred to ground ($-40^\circ\text{C} < T_j < 150^\circ\text{C}$).

4.3 MCU I/Os protection

If a ground protection network is used and negative transients are present on the V_{CC} line, the control pins will be pulled negative. ST suggests to insert a resistor (R_{prot}) in line both to prevent the microcontroller I/O pins from latching-up and to protect the HSD inputs.

The value of these resistors is a compromise between the leakage current of microcontroller and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of microcontroller I/Os.

Equation

$$V_{CCpeak} / I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH} - V_{GND}) / I_{IHmax}$$

Calculation example:

For $V_{CCpeak} = -150\text{ V}$; $I_{latchup} \geq 20\text{ mA}$; $V_{OH\mu C} \geq 4.5\text{ V}$

$7.5\text{ k}\Omega \leq R_{prot} \leq 140\text{ k}\Omega$.

Recommended values: $R_{prot} = 15\text{ k}\Omega$

4.4 CS - analog current sense

Diagnostic information on device and load status are provided by an analog output pin (CS) delivering the following signals:

- Current monitor: current mirror of channel output current

Those signals are routed through an analog multiplexer which is configured and controlled by means of SELx and SEn pins, according to the address map in *MultiSense multiplexer addressing Table*.

Figure 36: CurrectSense and diagnostic – block diagram

4.4.1 Principle of CurrentSense signal generation

Figure 37: CurrentSense block diagram

Current sense

This current mode is selected in the MultiSense, this output is capable to provide:

- Current mirror proportional to the load current in normal operation, delivering current proportional to the load according to known ratio named **K**
- Diagnostics flag in fault conditions delivering fixed voltage V_{SENSEH}

The current delivered by the current sense circuit, I_{SENSE} , can be easily converted to a voltage V_{SENSE} by using an external sense resistor, R_{SENSE} , allowing continuous load monitoring and abnormal condition detection.

Normal operation (channel ON, no fault, SEn active)

While device is operating in normal conditions (no fault intervention), V_{SENSE} calculation can be done using simple equations

Current provided by CS output: $I_{SENSE} = I_{OUT}/K$

Voltage on R_{SENSE} : $V_{SENSE} = R_{SENSE} \cdot I_{SENSE} = R_{SENSE} \cdot I_{OUT}/K$

Where:

- V_{SENSE} is voltage measurable on R_{SENSE} resistor
- I_{SENSE} is current provided from CS pin in current output mode

- I_{OUT} is current flowing through output
- K factor represents the ratio between PowerMOS cells and SenseMOS cells; its spread includes geometric factor spread, current sense amplifier offset and process parameters spread of the overall circuitry the specifying ratio between I_{OUT} and I_{SENSE} .

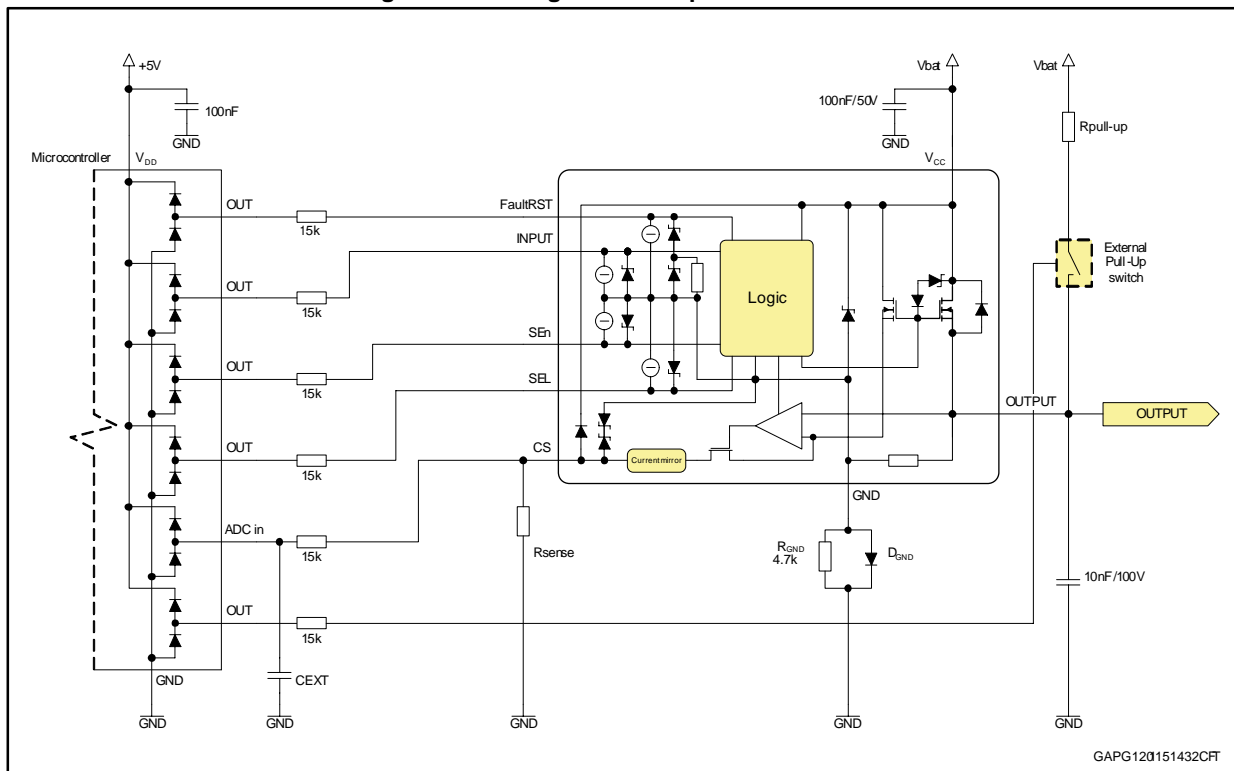

Failure flag indication

In case of power limitation/overtemperature, the fault is indicated by the CS pin which is switched to a “current limited” voltage source, V_{SENSEH} .

In any case, the current sourced by the CS in this condition is limited to I_{SENSEH} .

The typical behavior in case of overload or hard short circuit is shown in *Waveforms section*.

Figure 38: Analogue HSD – open-load detection in off-state

GAPG1201151432CFT

Figure 39: Open-load / short to VCC condition

Table 13: CurrentSense pin levels in off-state

Condition	Output	CS	SEn
Open-load	$V_{OUT} > V_{OL}$	Hi-Z	L
	$V_{OUT} < V_{OL}$	V_{SENSEH}	H
Short to V_{CC}	$V_{OUT} > V_{OL}$	Hi-Z	L
	$V_{OUT} < V_{OL}$	0	H
Nominal	$V_{OUT} > V_{OL}$	Hi-Z	L
	$V_{OUT} < V_{OL}$	0	H

4.4.2 Short to VCC and OFF-state open-load detection

Short to V_{CC}

A short circuit between V_{CC} and output is indicated by the relevant current sense pin set to V_{SENSEH} during the device off-state. Small or no current is delivered by the current sense during the on-state depending on the nature of the short circuit.

OFF-state open-load with external circuitry

Detection of an open-load in off mode requires an external pull-up resistor R_{PU} connecting the output to a positive supply voltage V_{PU} .

It is preferable that V_{PU} is switched off during the module standby mode in order to avoid the overall standby current consumption to increase in normal conditions, i.e. when load is connected.

R_{PU} must be selected in order to ensure V_{OUT} > V_{OLmax} in accordance with the following equation:

Equation

$$R_{PU} < \frac{V_{PU} - 4}{I_{L(off2)min @ 4V}}$$

5 Package and PCB thermal data

5.1 PowerSSO-16 thermal data

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
