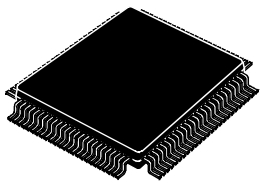
32-bit Power Architecture® based MCU with 576 KB Flash memory and 40 KB SRAM for automotive chassis and safety applications

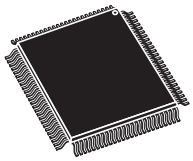
Datasheet – production data

Features

- 64 MHz, single issue, 32-bit CPU core complex (e200z0h)
  - Compliant with Power Architecture® embedded category
  - Variable Length Encoding (VLE)
- Memory organization
  - Up to 512 KB on-chip code flash memory with ECC and erase/program controller
  - Additional 64 (4 × 16) KB on-chip data flash memory with ECC for EEPROM emulation
  - Up to 40 KB on-chip SRAM with ECC
- Fail safe protection
  - Programmable watchdog timer
  - Non-maskable interrupt
  - Fault collection unit
- Nexus L2+ interface
- Interrupts
  - 16-channel eDMA controller
  - 16 priority level controller
- General purpose I/Os individually programmable as input, output or special function
- 2 general purpose eTimer units
  - 6 timers each with up/down count capabilities
  - 16-bit resolution, cascadable counters
  - Quadrature decode with rotation direction flag
  - Double buffer input capture and output compare
- Communications interfaces
  - 2 LINFlex channels (LIN 2.1)
  - 4 DSPI channels with automatic chip select generation
  - 1 FlexCAN interface (2.0B Active) with 32 message objects



LQFP144 (20 x 20 x 1.4 mm)



LQFP100 (14 x 14 x 1.4 mm)

  - 1 safety port based on FlexCAN with 32 message objects and up to 7.5 Mbit/s capability; usable as second CAN when not used as safety port
  - 1 FlexRay™ module (V2.1) with selectable dual or single channel support, 32 message objects and up to 10 Mbit/s (512 KB device only)
- Two 10-bit analog-to-digital converters (ADC)
  - 2 × 11 input channels, + 4 shared channels
  - Conversion time < 1 µs including sampling time at full precision
  - Programmable ADC Cross Triggering Unit (CTU)
  - 4 analog watchdogs with interrupt capability
- On-chip CAN/UART bootstrap loader with Boot Assist Module (BAM)
- 1 FlexPWM unit: 8 complementary or independent outputs with ADC synchronization signals

1 Introduction

1.1 Document overview

This document provides electrical specifications, pin assignments, and package diagrams for the SPC560P44/50 series of microcontroller units (MCUs). It also describes the device features and highlights important electrical and physical characteristics. For functional characteristics, refer to the device reference manual.

1.2 Description

This 32-bit system-on-chip (SoC) automotive microcontroller family is the latest achievement in integrated automotive application controllers. It belongs to an expanding range of automotive-focused products designed to address chassis applications—specifically, electrical hydraulic power steering (EHPS) and electric power steering (EPS)—as well as airbag applications.

This family is one of a series of next-generation integrated automotive microcontrollers based on the Power Architecture technology.

The advanced and cost-efficient host processor core of this automotive controller family complies with the Power Architecture embedded category. It operates at speeds of up to 64 MHz and offers high performance processing optimized for low power consumption. It capitalizes on the available development infrastructure of current Power Architecture devices and is supported with software drivers, operating systems and configuration code to assist with users implementations.

1.3 Device comparison

Table 2 provides a summary of different members of the SPC560P44Lx, SPC560P50Lx family and their features—relative to full-featured version—to enable a comparison among the family members and an understanding of the range of functionality offered within this family.

Table 4. SPC560P44Lx, SPC560P50Lx series block summary

Block	Function
Analog-to-digital converter (ADC)	Multi-channel, 10-bit analog-to-digital converter
Boot assist module (BAM)	Block of read-only memory containing VLE code which is executed according to the boot mode of the device
Clock generation module (MC_CGM)	Provides logic and control required for the generation of system and peripheral clocks
Controller area network (FlexCAN)	Supports the standard CAN communications protocol
Cross triggering unit (CTU)	Enables synchronization of ADC conversions with a timer event from the eMIOS or from the PIT
Crossbar switch (XBAR)	Supports simultaneous connections between two master ports and three slave ports; supports a 32-bit address bus width and a 32-bit data bus width
Cyclic redundancy check (CRC)	CRC checksum generator
Deserial serial peripheral interface (DSPI)	Provides a synchronous serial interface for communication with external devices
Enhanced direct memory access (eDMA)	Performs complex data transfers with minimal intervention from a host processor via "*n*" programmable channels
Enhanced timer (eTimer)	Provides enhanced programmable up/down modulo counting
Error correction status module (ECSM)	Provides a myriad of miscellaneous control functions for the device including program-visible information about configuration and revision levels, a reset status register, wakeup control for exiting sleep modes, and optional features such as information on memory errors reported by error-correcting codes
External oscillator (XOSC)	Provides an output clock used as input reference for FMPLL_0 or as reference clock for specific modules depending on system needs
Fault collection unit (FCU)	Provides functional safety to the device
Flash memory	Provides non-volatile storage for program code, constants and variables
Frequency-modulated phase-locked loop (FMPLL)	Generates high-speed system clocks and supports programmable frequency modulation
Interrupt controller (INTC)	Provides priority-based preemptive scheduling of interrupt requests
JTAG controller	Provides the means to test chip functionality and connectivity while remaining transparent to system logic when not in test mode
LINFlex controller	Manages a high number of LIN (Local Interconnect Network protocol) messages efficiently with minimum load on CPU
Mode entry module (MC_ME)	Provides a mechanism for controlling the device operational mode and mode transition sequences in all functional states; also manages the power control unit, reset generation module and clock generation module, and holds the configuration, control and status registers accessible for applications
Periodic interrupt timer (PIT)	Produces periodic interrupts and triggers
Peripheral bridge (PBRIDGE)	Interface between the system bus and on-chip peripherals
Power control unit (MC_PCU)	Reduces the overall power consumption by disconnecting parts of the device from the power supply via a power switching device; device components are grouped into sections called "power domains" which are controlled by the PCU

Table 4. SPC560P44Lx, SPC560P50Lx series block summary (continued)

Block	Function
Pulse width modulator (FlexPWM)	Contains four PWM submodules, each of which is capable of controlling a single half-bridge power stage and two fault input channels
Reset generation module (MC_RGM)	Centralizes reset sources and manages the device reset sequence of the device
Static random-access memory (SRAM)	Provides storage for program code, constants, and variables
System integration unit lite (SIUL)	Provides control over all the electrical pad controls and up 32 ports with 16 bits of bidirectional, general-purpose input and output signals and supports up to 32 external interrupts with trigger event configuration
System status and configuration module (SSCM)	Provides system configuration and status data (such as memory size and status, device mode and security status), device identification data, debug status port enable and selection, and bus and peripheral abort enable/disable
System timer module (STM)	Provides a set of output compare events to support AUTOSAR(1) and operating system tasks
System watchdog timer (SWT)	Provides protection from runaway code
Wakeup unit (WKPU)	Supports up to 18 external sources that can generate interrupts or wakeup events, 1 of which can cause non-maskable interrupt requests or wakeup events

1.5 Feature details

1.5.1 High performance e200z0 core processor

The e200z0 Power Architecture core provides the following features:

- High performance e200z0 core processor for managing peripherals and interrupts
- Single issue 4-stage pipeline in-order execution 32-bit Power Architecture CPU
- Harvard architecture
- Variable length encoding (VLE), allowing mixed 16-bit and 32-bit instructions
  - Results in smaller code size footprint
  - Minimizes impact on performance
- Branch processing acceleration using lookahead instruction buffer
- Load/store unit
  - 1 cycle load latency
  - Misaligned access support
  - No load-to-use pipeline bubbles
- Thirty-two 32-bit general purpose registers (GPRs)
- Separate instruction bus and load/store bus Harvard architecture
- Hardware vectored interrupt support
- Reservation instructions for implementing read-modify-write constructs
- Long cycle time instructions, except for guarded loads, do not increase interrupt latency
- Extensive system development support through Nexus debug port
- Non-maskable interrupt support

1.5.2 Crossbar switch (XBAR)

The XBAR multi-port crossbar switch supports simultaneous connections between four master ports and three slave ports. The crossbar supports a 32-bit address bus width and a 32-bit data bus width.

The crossbar allows for two concurrent transactions to occur from any master port to any slave port; but one of those transfers must be an instruction fetch from internal flash memory. If a slave port is simultaneously requested by more than one master port, arbitration logic will select the higher priority master and grant it ownership of the slave port. All other masters requesting that slave port will be stalled until the higher priority master completes its transactions. Requesting masters will be treated with equal priority and will be granted access to a slave port in round-robin fashion, based upon the ID of the last master to be granted access.

The crossbar provides the following features:

- 4 master ports:
  - e200z0 core complex Instruction port
  - e200z0 core complex Load/Store Data port
  - eDMA
  - FlexRay
- 3 slave ports:
  - Flash memory (code flash and data flash)
  - SRAM
  - Peripheral bridge
- 32-bit internal address, 32-bit internal data paths
- Fixed Priority Arbitration based on Port Master
- Temporary dynamic priority elevation of masters

1.5.3 Enhanced direct memory access (eDMA)

The enhanced direct memory access (eDMA) controller is a second-generation module capable of performing complex data movements via 16 programmable channels, with minimal intervention from the host processor. The hardware micro architecture includes a DMA engine which performs source and destination address calculations, and the actual data movement operations, along with an SRAM-based memory containing the transfer control descriptors (TCD) for the channels. This implementation is utilized to minimize the overall block size.

The eDMA module provides the following features:

- 16 channels support independent 8, 16 or 32-bit single value or block transfers
- Supports variable sized queues and circular queues
- Source and destination address registers are independently configured to either post-increment or to remain constant
- Each transfer is initiated by a peripheral, CPU, or eDMA channel request
- Each eDMA channel can optionally send an interrupt request to the CPU on completion of a single value or block transfer
- DMA transfers possible between system memories, DSPIs, ADC, FlexPWM, eTimer and CTU
- Programmable DMA channel multiplexer for assignment of any DMA source to any available DMA channel with as many as 30 request sources
- eDMA abort operation through software

1.5.4 Flash memory

The SPC560P44Lx, SPC560P50Lx provides as much as 576 KB of programmable, non-volatile, flash memory. The non-volatile memory (NVM) can be used for instruction and/or data storage. The flash memory module interfaces the system bus to a dedicated flash memory array controller. It supports a 32-bit data bus width at the system bus port, and a 128-bit read data interface to flash memory. The module contains four 128-bit wide prefetch buffers. Prefetch buffer hits allow no-wait responses. Normal flash memory array accesses are registered and are forwarded to the system bus on the following cycle, incurring two wait-states.

The flash memory module provides the following features:

- As much as 576 KB flash memory
  - 8 blocks (32 KB + 2×16 KB + 32 KB + 32 KB + 3×128 KB) code flash
  - 4 blocks (16 KB + 16 KB + 16 KB + 16 KB) data flash
  - Full Read While Write (RWW) capability between code and data flash
- Four 128-bit wide prefetch buffers to provide single cycle in-line accesses (prefetch buffers can be configured to prefetch code or data or both)
- Typical flash memory access time: 0 wait states for buffer hits, 2 wait states for page buffer miss at 64 MHz
- Hardware managed flash memory writes handled by 32-bit RISC Krypton engine
- Hardware and software configurable read and write access protections on a per-master basis
- Configurable access timing allowing use in a wide range of system frequencies
- Multiple-mapping support and mapping-based block access timing (up to 31 additional cycles) allowing use for emulation of other memory types.
- Software programmable block program/erase restriction control
- Erase of selected block(s)
- Read page sizes
  - Code flash memory: 128 bits (4 words)
  - Data flash memory: 32 bits (1 word)
- ECC with single-bit correction, double-bit detection for data integrity
  - Code flash memory: 64-bit ECC
  - Data flash memory: 64-bit ECC
- Embedded hardware program and erase algorithm
- Erase suspend, program suspend and erase-suspended program
- Censorship protection scheme to prevent flash memory content visibility
- Hardware support for EEPROM emulation

1.5.5 Static random access memory (SRAM)

The SPC560P44Lx, SPC560P50Lx SRAM module provides up to 40 KB of general-purpose memory.

The SRAM module provides the following features:

- Supports read/write accesses mapped to the SRAM from any master
- Up to 40 KB general purpose SRAM
- Supports byte (8-bit), half word (16-bit), and word (32-bit) writes for optimal use of memory
- Typical SRAM access time: 0 wait-state for reads and 32-bit writes; 1 wait state for 8- and 16-bit writes if back to back with a read to same memory block

1.5.6 Interrupt controller (INTC)

The interrupt controller (INTC) provides priority-based preemptive scheduling of interrupt requests, suitable for statically scheduled hard real-time systems. The INTC handles 147 selectable-priority interrupt sources.

For high priority interrupt requests, the time from the assertion of the interrupt request from the peripheral to when the processor is executing the interrupt service routine (ISR) has been minimized. The INTC provides a unique vector for each interrupt request source for quick determination of which ISR has to be executed. It also provides a wide number of priorities so that lower priority ISRs do not delay the execution of higher priority ISRs. To allow the appropriate priorities for each source of interrupt request, the priority of each interrupt request is software configurable.

When multiple tasks share a resource, coherent accesses to that resource need to be supported. The INTC supports the priority ceiling protocol (PCP) for coherent accesses. By providing a modifiable priority mask, the priority can be raised temporarily so that all tasks which share the same resource can not preempt each other.

The INTC provides the following features:

- Unique 9-bit vector for each separate interrupt source
- 8 software triggerable interrupt sources
- 16 priority levels with fixed hardware arbitration within priority levels for each interrupt source
- Ability to modify the ISR or task priority: modifying the priority can be used to implement the Priority Ceiling Protocol for accessing shared resources.
- 2 external high priority interrupts directly accessing the main core and I/O processor (IOP) critical interrupt mechanism

1.5.7 System status and configuration module (SSCM)

The system status and configuration module (SSCM) provides central device functionality.

The SSCM includes these features:

- System configuration and status
  - Memory sizes/status
  - Device mode and security status
  - Determine boot vector
  - Search code flash for bootable sector
  - DMA status
- Debug status port enable and selection
- Bus and peripheral abort enable/disable

1.5.8 System clocks and clock generation

The following list summarizes the system clock and clock generation on the SPC560P44Lx, SPC560P50Lx:

- Lock detect circuitry continuously monitors lock status
- Loss of clock (LOC) detection for PLL outputs
- Programmable output clock divider (÷1, ÷2, ÷4, ÷8)
- FlexPWM module and eTimer module can run on an independent clock source
- On-chip oscillator with automatic level control
- Internal 16 MHz RC oscillator for rapid start-up and safe mode: supports frequency trimming by user application

1.5.9 Frequency-modulated phase-locked loop (FMPLL)

The FMPLL allows the user to generate high speed system clocks from a 4–40 MHz input clock. Further, the FMPLL supports programmable frequency modulation of the system clock. The PLL multiplication factor, output clock divider ratio are all software configurable.

The PLL has the following major features:

- Input clock frequency: 4–40 MHz
- Maximum output frequency: 64 MHz
- Voltage controlled oscillator (VCO)—frequency 256–512 MHz
- Reduced frequency divider (RFD) for reduced frequency operation without forcing the PLL to relock
- Frequency-modulated PLL
  - Modulation enabled/disabled through software
  - Triangle wave modulation
- Programmable modulation depth (±0.25% to ±4% deviation from center frequency): programmable modulation frequency dependent on reference frequency
- Self-clocked mode (SCM) operation

1.5.10 Main oscillator

The main oscillator provides these features:

- Input frequency range: 4–40 MHz
- Crystal input mode or oscillator input mode
- PLL reference

1.5.11 Internal RC oscillator

This device has an RC ladder phase-shift oscillator. The architecture uses constant current charging of a capacitor. The voltage at the capacitor is compared by the stable bandgap reference voltage.

The RC oscillator provides these features:

- Nominal frequency 16 MHz
- ±5% variation over voltage and temperature after process trim
- Clock output of the RC oscillator serves as system clock source in case loss of lock or loss of clock is detected by the PLL
- RC oscillator is used as the default system clock during startup

1.5.12 Periodic interrupt timer (PIT)

The PIT module implements these features:

- 4 general purpose interrupt timers
- 32-bit counter resolution
- Clocked by system clock frequency
- Each channel can be used as trigger for a DMA request

1.5.13 System timer module (STM)

The STM module implements these features:

- One 32-bit up counter with 8-bit prescaler
- Four 32-bit compare channels
- Independent interrupt source for each channel
- Counter can be stopped in debug mode

1.5.14 Software watchdog timer (SWT)

The SWT has the following features:

- 32-bit time-out register to set the time-out period
- Programmable selection of system or oscillator clock for timer operation
- Programmable selection of window mode or regular servicing
- Programmable selection of reset or interrupt on an initial time-out
- Master access protection
- Hard and soft configuration lock bits
- Reset configuration inputs allow timer to be enabled out of reset

1.5.15 Fault collection unit (FCU)

The FCU provides an independent fault reporting mechanism even if the CPU is malfunctioning.

The FCU module has the following features:

- FCU status register reporting the device status
- Continuous monitoring of critical fault signals
- User selection of critical signals from different fault sources inside the device
- Critical fault events trigger 2 external pins (user selected signal protocol) that can be used externally to reset the device and/or other circuitry (for example, safety relay or FlexRay transceiver)
- Faults are latched into a register

1.5.16 System integration unit – Lite (SIUL)

The SPC560P44Lx, SPC560P50Lx SIUL controls MCU pad configuration, external interrupt, general purpose I/O (GPIO), and internal peripheral multiplexing.

The pad configuration block controls the static electrical characteristics of I/O pins. The GPIO block provides uniform and discrete input/output control of the I/O pins of the MCU.

The SIU provides the following features:

- Centralized general purpose input output (GPIO) control of as many as 80 input/output pins and 26 analog input-only pads (package dependent)
- All GPIO pins can be independently configured to support pull-up, pull down, or no pull
- Reading and writing to GPIO supported both as individual pins and 16-bit wide ports
- All peripheral pins (except ADC channels) can be alternatively configured as both general purpose input or output pins
- ADC channels support alternative configuration as general purpose inputs
- Direct readback of the pin value is supported on all pins through the SIUL
- Configurable digital input filter that can be applied to some general purpose input pins for noise elimination: as many as 4 internal functions can be multiplexed onto 1 pin

1.5.17 Boot and censorship

Different booting modes are available in the SPC560P44Lx, SPC560P50Lx: booting from internal flash memory and booting via a serial link.

The default booting scheme uses the internal flash memory (an internal pull-down is used to select this mode). Optionally, the user can boot via FlexCAN or LINFlex (using the boot assist module software).

A censorship scheme is provided to protect the content of the flash memory and offer increased security for the entire device.

A password mechanism is designed to grant the legitimate user access to the non-volatile memory.

Boot assist module (BAM)

The BAM is a block of read-only one-time programmed memory and is identical for all SPC560Pxx devices that are based on the e200z0h core. The BAM program is executed every time the device is powered on if the alternate boot mode has been selected by the user.

The BAM provides the following features:

- Serial bootloading via FlexCAN or LINFlex
- Ability to accept a password via the used serial communication channel to grant the legitimate user access to the non-volatile memory

1.5.18 Error correction status module (ECSM)

The ECSM provides a myriad of miscellaneous control functions regarding program-visible information about the platform configuration and revision levels, a reset status register, a software watchdog timer, wakeup control for exiting sleep modes, and information on platform memory errors reported by error-correcting codes and/or generic access error information for certain processor cores.

The Error Correction Status Module supports a number of miscellaneous control functions for the platform. The ECSM includes these features:

- Registers for capturing information on platform memory errors if error-correcting codes (ECC) are implemented
- For test purposes, optional registers to specify the generation of double-bit memory errors are enabled on the SPC560P44Lx, SPC560P50Lx.

The sources of the ECC errors are:

- Flash memory
- SRAM

1.5.19 Peripheral bridge (PBRIDGE)

The PBRIDGE implements the following features:

- Duplicated periphery
- Master access privilege level per peripheral (per master: read access enable; write access enable)
- Write buffering for peripherals
- Checker applied on PBRIDGE output toward periphery
- Byte endianess swap capability

1.5.20 Controller area network (FlexCAN)

The SPC560P44Lx, SPC560P50Lx MCU contains one controller area network (FlexCAN) module. This module is a communication controller implementing the CAN protocol according to Bosch Specification version 2.0B. The CAN protocol was designed to be used primarily as a vehicle serial data bus, meeting the specific requirements of this field: real-time processing, reliable operation in the EMI environment of a vehicle, cost-effectiveness and required bandwidth. The FlexCAN module contains 32 message buffers.

The FlexCAN module provides the following features:

- Full implementation of the CAN protocol specification, version 2.0B
  - Standard data and remote frames
  - Extended data and remote frames
  - Up to 8-bytes data length
  - Programmable bit rate up to 1 Mbit/s
- 32 message buffers of up to 8-bytes data length
- Each message buffer configurable as Rx or Tx, all supporting standard and extended messages
- Programmable loop-back mode supporting self-test operation
- 3 programmable mask registers
- Programmable transmit-first scheme: lowest ID or lowest buffer number
- Time stamp based on 16-bit free-running timer
- Global network time, synchronized by a specific message
- Maskable interrupts
- Independent of the transmission medium (an external transceiver is assumed)
- High immunity to EMI
- Short latency time due to an arbitration scheme for high-priority messages
- Transmit features
  - Supports configuration of multiple mailboxes to form message queues of scalable depth
  - Arbitration scheme according to message ID or message buffer number
  - Internal arbitration to guarantee no inner or outer priority inversion
  - Transmit abort procedure and notification
- Receive features
  - Individual programmable filters for each mailbox
  - 8 mailboxes configurable as a six-entry receive FIFO
  - 8 programmable acceptance filters for receive FIFO
- Programmable clock source
  - System clock
  - Direct oscillator clock to avoid PLL jitter

1.5.21 Safety port (FlexCAN)

The SPC560P44Lx, SPC560P50Lx MCU has a second CAN controller synthesized to run at high bit rates to be used as a safety port. The CAN module of the safety port provides the following features:

- Identical to the FlexCAN module
- Bit rate as fast as 7.5 Mbit/s at 60 MHz CPU clock using direct connection between CAN modules (no physical transceiver required)
- 32 message buffers of up to 8 bytes data length
- Can be used as a second independent CAN module

1.5.22 FlexRay

The FlexRay module provides the following features:

- Full implementation of FlexRay Protocol Specification 2.1
- 32 configurable message buffers can be handled
- Dual channel or single channel mode of operation, each as fast as 10 Mbit/s data rate
- Message buffers configurable as Tx, Rx or RxFIFO
- Message buffer size configurable
- Message filtering for all message buffers based on FrameID, cycle count and message ID
- Programmable acceptance filters for RxFIFO message buffers

1.5.23 Serial communication interface module (LINFlex)

The LINFlex (local interconnect network flexible) on the SPC560P44Lx, SPC560P50Lx features the following:

- Supports LIN Master mode, LIN Slave mode and UART mode
- LIN state machine compliant to LIN1.3, 2.0, and 2.1 specifications
- Handles LIN frame transmission and reception without CPU intervention
- LIN features
  - Autonomous LIN frame handling
  - Message buffer to store Identifier and as much as 8 data bytes
  - Supports message length as long as 64 bytes
  - Detection and flagging of LIN errors (sync field, delimiter, ID parity, bit framing, checksum, and time-out)
  - Classic or extended checksum calculation
  - Configurable Break duration as long as 36-bit times
  - Programmable baud rate prescalers (13-bit mantissa, 4-bit fractional)
  - Diagnostic features: Loop back; Self Test; LIN bus stuck dominant detection
  - Interrupt-driven operation with 16 interrupt sources
- LIN slave mode features
  - Autonomous LIN header handling
  - Autonomous LIN response handling
- UART mode
  - Full-duplex operation
  - Standard non return-to-zero (NRZ) mark/space format
  - Data buffers with 4-byte receive, 4-byte transmit
  - Configurable word length (8-bit or 9-bit words)
  - Error detection and flagging
  - Parity, Noise and Framing errors
  - Interrupt-driven operation with four interrupt sources
  - Separate transmitter and receiver CPU interrupt sources
  - 16-bit programmable baud-rate modulus counter and 16-bit fractional
  - 2 receiver wake-up methods

1.5.24 Deserial serial peripheral interface (DSPI)

The deserial serial peripheral interface (DSPI) module provides a synchronous serial interface for communication between the SPC560P44Lx, SPC560P50Lx MCU and external devices.

The DSPI modules provide these features:

- Full duplex, synchronous transfers
- Master or slave operation
- Programmable master bit rates
- Programmable clock polarity and phase
- End-of-transmission interrupt flag
- Programmable transfer baud rate
- Programmable data frames from 4 to 16 bits
- Up to 20 chip select lines available
  - 8 on DSPI_0
  - 4 each on DSPI_1, DSPI_2 and DSPI_3
- 8 clock and transfer attributes registers
- Chip select strobe available as alternate function on one of the chip select pins for deglitching
- FIFOs for buffering as many as 5 transfers on the transmit and receive side
- Queueing operation possible through use of the eDMA
- General purpose I/O functionality on pins when not used for SPI

1.5.25 Pulse width modulator (FlexPWM)

The pulse width modulator module (PWM) contains four PWM submodules, each capable of controlling a single half-bridge power stage. There are also four fault channels.

This PWM is capable of controlling most motor types: AC induction motors (ACIM), permanent magnet AC motors (PMAC), both brushless (BLDC) and brush DC motors (BDC), switched (SRM) and variable reluctance motors (VRM), and stepper motors.

The FlexPWM block implements the following features:

- 16-bit resolution for center, edge-aligned, and asymmetrical PWMs
- Maximum operating clock frequency of 120 MHz
- PWM outputs can operate as complementary pairs or independent channels
- Can accept signed numbers for PWM generation
- Independent control of both edges of each PWM output
- Synchronization to external hardware or other PWM supported
- Double buffered PWM registers
  - Integral reload rates from 1 to 16
  - Half cycle reload capability
- Multiple ADC trigger events can be generated per PWM cycle via hardware
- Write protection for critical registers
- Fault inputs can be assigned to control multiple PWM outputs
- Programmable filters for fault inputs
- Independently programmable PWM output polarity
- Independent top and bottom deadtime insertion
- Each complementary pair can operate with its own PWM frequency and deadtime values
- Individual software-control for each PWM output
- All outputs can be programmed to change simultaneously via a “Force Out” event
- PWMX pin can optionally output a third PWM signal from each submodule
- Channels not used for PWM generation can be used for buffered output compare functions
- Channels not used for PWM generation can be used for input capture functions
- Enhanced dual-edge capture functionality
- eDMA support with automatic reload
- 2 fault inputs
- Capture capability for PWMA, PWMB, and PWMX channels not supported

1.5.26 eTimer

The SPC560P44Lx, SPC560P50Lx includes two eTimer modules. Each module provides six 16-bit general purpose up/down timer/counter units with the following features:

- Maximum operating clock frequency of 120 MHz
- Individual channel capability
  - Input capture trigger
  - Output compare
  - Double buffer (to capture rising edge and falling edge)
  - Separate prescaler for each counter
  - Selectable clock source
  - 0–100% pulse measurement
  - Rotation direction flag (Quad decoder mode)
- Maximum count rate
  - External event counting: max. count rate = peripheral clock/2
  - Internal clock counting: max. count rate = peripheral clock
- Counters are:
  - Cascadable
  - Preloadable
- Programmable count modulo
- Quadrature decode capabilities
- Counters can share available input pins
- Count once or repeatedly
- Pins available as GPIO when timer functionality not in use

1.5.27 Analog-to-digital converter (ADC) module

The ADC module provides the following features:

Analog part:

- 2 on-chip AD converters
  - 10-bit AD resolution
  - 1 sample and hold unit per ADC
  - Conversion time, including sampling time, less than 1 µs (at full precision)
  - Typical sampling time is 150 ns min. (at full precision)
  - Differential non-linearity error (DNL) ±1 LSB
  - Integral non-linearity error (INL) ±1.5 LSB
  - TUE <3 LSB
  - Single-ended input signal up to 5.0 V
  - The ADC and its reference can be supplied with a voltage independent from V_{DDIO}
  - The ADC supply can be equal or higher than V_{DDIO}
  - The ADC supply and the ADC reference are not independent from each other (they are internally bonded to the same pad)
  - Sample times of 2 (default), 8, 64, or 128 ADC clock cycles

Digital part:

- 2 × 13 input channels including 4 channels shared between the 2 converters
- 4 analog watchdogs comparing ADC results against predefined levels (low, high, range) before results are stored in the appropriate ADC result location,
- 2 modes of operation: Normal mode or CTU control mode
- Normal mode features
  - Register-based interface with the CPU: control register, status register, 1 result register per channel
  - ADC state machine managing 3 request flows: regular command, hardware injected command, software injected command
  - Selectable priority between software and hardware injected commands
  - 4 analog watchdogs comparing ADC results against predefined levels (low, high, range)
  - DMA compatible interface
- CTU control mode features
  - Triggered mode only
  - 4 independent result queues (2 × 16 entries, 2 × 4 entries)
  - Result alignment circuitry (left justified; right justified)
  - 32-bit read mode allows to have channel ID on one of the 16-bit part
  - DMA compatible interfaces

1.5.28 Cross triggering unit (CTU)

The cross triggering unit allows automatic generation of ADC conversion requests on user selected conditions without CPU load during the PWM period and with minimized CPU load for dynamic configuration.

It implements the following features:

- Double buffered trigger generation unit with as many as eight independent triggers generated from external triggers
- Trigger generation unit configurable in sequential mode or in triggered mode
- Each Trigger can be appropriately delayed to compensate the delay of external low pass filter
- Double buffered global trigger unit allowing eTimer synchronization and/or ADC command generation
- Double buffered ADC command list pointers to minimize ADC-trigger unit update
- Double buffered ADC conversion command list with as many as 24 ADC commands
- Each trigger has the capability to generate consecutive commands
- ADC conversion command allows to control ADC channel from each ADC, single or synchronous sampling, independent result queue selection

1.5.29 Nexus development interface (NDI)

The NDI (Nexus Development Interface) block provides real-time development support capabilities for the SPC560P44Lx, SPC560P50Lx Power Architecture based MCU in compliance with the IEEE-ISTO 5001-2003 standard. This development support is supplied for MCUs without requiring external address and data pins for internal visibility. The NDI

block is an integration of several individual Nexus blocks that are selected to provide the development support interface for this device. The NDI block interfaces to the host processor and internal busses to provide development support as per the IEEE-ISTO 5001-2003 Class 2+ standard. The development support provided includes access to the MCU's internal memory map and access to the processor's internal registers during run time.

The Nexus Interface provides the following features:

- Configured via the IEEE 1149.1
- All Nexus port pins operate at V_{DDIO} (no dedicated power supply)
- Nexus 2+ features supported
  - Static debug
  - Watchpoint messaging
  - Ownership trace messaging
  - Program trace messaging
  - Real time read/write of any internally memory mapped resources through JTAG pins
  - Overrun control, which selects whether to stall before Nexus overruns or keep executing and allow overwrite of information
  - Watchpoint triggering, watchpoint triggers program tracing
- Auxiliary Output Port
  - 4 MDO (Message Data Out) pins
  - MCKO (Message Clock Out) pin
  - 2 $\overline{\text{MSEO}}$ (Message Start/End Out) pins
  - $\overline{\text{EVTO}}$ (Event Out) pin
- Auxiliary Input Port
  - $\overline{\text{EVTI}}$ (Event In) pin

1.5.30 Cyclic redundancy check (CRC)

The CRC computing unit is dedicated to the computation of CRC off-loading the CPU. The CRC module features:

- Support for CRC-16-CCITT (*x*25 protocol):
  - $x^{16} + x^{12} + x^5 + 1$
- Support for CRC-32 (Ethernet protocol):
  - $x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$
- Zero wait states for each write/read operations to the CRC_CFG and CRC_INP registers at the maximum frequency

1.5.31 IEEE 1149.1 JTAG controller

The JTAG controller (JTAGC) block provides the means to test chip functionality and connectivity while remaining transparent to system logic when not in test mode. All data input to and output from the JTAGC block is communicated in serial format. The JTAGC block is compliant with the IEEE standard.

The JTAG controller provides the following features:

- IEEE Test Access Port (TAP) interface with 4 pins (TDI, TMS, TCK, TDO)
- Selectable modes of operation include JTAGC/debug or normal system operation.
- A 5-bit instruction register that supports the following IEEE 1149.1-2001 defined instructions:
  - BYPASS, IDCODE, EXTEST, SAMPLE, SAMPLE/PRELOAD
- A 5-bit instruction register that supports the additional following public instructions:
  - ACCESS_AUX_TAP_NPC, ACCESS_AUX_TAP_ONCE
- 3 test data registers: a bypass register, a boundary scan register, and a device identification register.
- A TAP controller state machine that controls the operation of the data registers, instruction register and associated circuitry.

1.5.32 On-chip voltage regulator (VREG)

The on-chip voltage regulator module provides the following features:

- Uses external NPN (negative-positive-negative) transistor
- Regulates external 3.3 V /5.0 V down to 1.2 V for the core logic
- Low voltage detection on the internal 1.2 V and I/O voltage 3.3 V

2 Package pinouts and signal descriptions

1. SCR values refer to the value assigned to the Slew Rate Control bits of the pad configuration register.

2.2.3 Pin muxing

Table 7 defines the pin list and muxing for the SPC560P44Lx, SPC560P50Lx devices.

Each row of *Table 7* shows all the possible ways of configuring each pin, via alternate functions. The default function assigned to each pin after reset is the ALT0 function.

SPC560P44Lx, SPC560P50Lx devices provide four main I/O pad types, depending on the associated functions:

- *Slow pads* are the most common, providing a compromise between transition time and low electromagnetic emission.
- *Medium pads* provide fast enough transition for serial communication channels with controlled current to reduce electromagnetic emission.
- *Fast pads* provide maximum speed. They are used for improved NEXUS debugging capability.
- *Symmetric pads* are designed to meet FlexRay requirements.

Medium and Fast pads can use slow configuration to reduce electromagnetic emission, at the cost of reducing AC performance. For more information, see the datasheet's "Pad AC Specifications" section.

1. ALT0 is the primary (default) function for each port after reset.
2. Alternate functions are chosen by setting the values of the PCR[PA] bitfields inside the SIU module. PCR[PA] = 00 → ALT0; PCR[PA] = 01 → ALT1; PCR[PA] = 10 → ALT2; PCR[PA] = 11 → ALT3. This is intended to select the output functions; to use one of the input-only functions, the PCR[IBE] bit must be written to '1', regardless of the values selected in the PCR[PA] bitfields. For this reason, the value corresponding to an input only function is reported as "—".
3. Module included on the MCU.
4. Multiple inputs are routed to all respective modules internally. The input of some modules must be configured by setting the values of the PSMI[PADSEL*x*] bitfields inside the SIUL module.
5. Programmable via the SRC (Slew Rate Control) bits in the respective Pad Configuration Register.
6. Weak pull down during reset.

3 Electrical characteristics

3.1 Introduction

This section contains device electrical characteristics as well as temperature and power considerations.

This microcontroller contains input protection against damage due to high static voltages. However, it is advisable to take precautions to avoid application of any voltage higher than the specified maximum rated voltages.

To enhance reliability, unused inputs can be driven to an appropriate logic voltage level (V_{DD} or V_{SS}). This can be done by the internal pull-up or pull-down resistors, which are provided by the device for most general purpose pins.

The following tables provide the device characteristics and its demands on the system.

In the tables where the device logic provides signals with their respective timing characteristics, the symbol “CC” for Controller Characteristics is included in the Symbol column.

In the tables where the external system must provide signals with their respective timing characteristics to the device, the symbol “SR” for System Requirement is included in the Symbol column.

Caution: All of the following parameter values can vary depending on the application and must be confirmed during silicon characterization or silicon reliability trial.

3.2 Parameter classification

The electrical parameters are guaranteed by various methods. To give the customer a better understanding, the classifications listed in *Table 8* are used and the parameters are tagged accordingly in the tables where appropriate.

Table 8. Parameter classifications

Classification tag	Tag description
P	Those parameters are guaranteed during production testing on each individual device.
C	Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations.
T	Those parameters are achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted. All values shown in the typical column are within this category.
D	Those parameters are derived mainly from simulations.

Note: The classification is shown in the column labeled “C” in the parameter tables where appropriate.

1. Functional operating conditions are given in the DC electrical characteristics. Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the listed maxima may affect device reliability or cause permanent damage to the device.
2. Absolute maximum voltages are currently maximum burn-in voltages. Absolute maximum specifications for device stress have not yet been determined.
3. The difference between each couple of voltage supplies must be less than 300 mV, $|V_{DD\_HV\_IOy} – V_{DD\_HV\_IOx}| < 300$ mV.
4. The difference between ADC voltage supplies must be less than 100 mV, $|V_{DD\_HV\_ADC1} – V_{DD\_HV\_ADC0}| < 100$ mV.
5. Guaranteed by device validation
6. Not allowed to refer this voltage to $V_{DD\_HV\_ADV1}$, $V_{SS\_HV\_ADV1}$
7. Not allowed to refer this voltage to $V_{DD\_HV\_ADV0}$, $V_{SS\_HV\_ADV0}$

Figure 5 shows the constraints of the different power supplies.

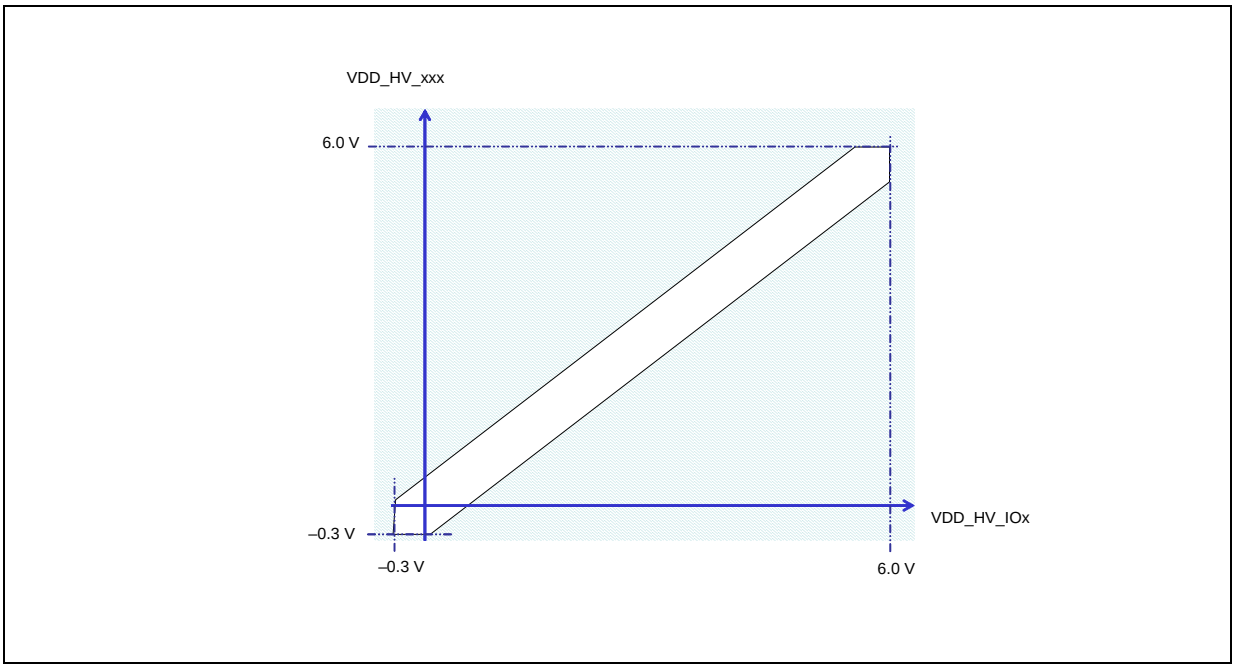

Figure 5. Power supplies constraints (–0.3 V ≤ $V_{DD\_HV\_IOx}$ ≤ 6.0 V)

The SPC560P44Lx, SPC560P50Lx supply architecture allows of having ADC supply managed independently from standard V_{DD_HV} supply. *Figure 6* shows the constraints of the ADC power supply.

3.5.2 General notes for specifications at maximum junction temperature

An estimation of the chip junction temperature, T_J, can be obtained from *Equation 1*:

Equation 1 $T_J = T_A + (R_{\theta JA} * P_D)$

where:

T_A = ambient temperature for the package (°C)

$R_{\theta JA}$ = junction to ambient thermal resistance (°C/W)

P_D = power dissipation in the package (W)

The junction to ambient thermal resistance is an industry standard value that provides a quick and easy estimation of thermal performance. Unfortunately, there are two values in

common usage: the value determined on a single layer board and the value obtained on a board with two planes. For packages such as the PBGA, these values can be different by a factor of two. Which value is closer to the application depends on the power dissipated by other components on the board. The value obtained on a single layer board is appropriate for the tightly packed printed circuit board. The value obtained on the board with the internal planes is usually appropriate if the board has low power dissipation and the components are well separated.

When a heat sink is used, the thermal resistance is expressed in *Equation 2* as the sum of a junction to case thermal resistance and a case to ambient thermal resistance:

Equation 2 $R_{\theta JA} = R_{\theta JC} + R_{\theta CA}$

where:

$R_{\theta JA}$ = junction to ambient thermal resistance (°C/W)

$R_{\theta JC}$ = junction to case thermal resistance (°C/W)

$R_{\theta CA}$ = case to ambient thermal resistance (°C/W)

$R_{\theta JC}$ is device related and cannot be influenced by the user. The user controls the thermal environment to change the case to ambient thermal resistance, $R_{\theta CA}$. For instance, the user can change the size of the heat sink, the air flow around the device, the interface material, the mounting arrangement on printed circuit board, or change the thermal dissipation on the printed circuit board surrounding the device.

To determine the junction temperature of the device in the application when heat sinks are not used, the Thermal Characterization Parameter (Ψ_{JT}) can be used to determine the junction temperature with a measurement of the temperature at the top center of the package case using *Equation 3*:

Equation 3 $T_J = T_T + (\Psi_{JT} \times P_D)$

where:

T_T = thermocouple temperature on top of the package (°C)

Ψ_{JT} = thermal characterization parameter (°C/W)

P_D = power dissipation in the package (W)

The thermal characterization parameter is measured per JESD51-2 specification using a 40 gauge type T thermocouple epoxied to the top center of the package case. The thermocouple should be positioned so that the thermocouple junction rests on the package. A small amount of epoxy is placed over the thermocouple junction and over about 1 mm of wire extending from the junction. The thermocouple wire is placed flat against the package case to avoid measurement errors caused by cooling effects of the thermocouple wire.

3.8 Power management electrical characteristics

3.8.1 Voltage regulator electrical characteristics

The internal voltage regulator requires an external NPN ballast to be connected as shown in *Figure 9*. *Table 16* contains all approved NPN ballast components. Capacitances should be placed on the board as near as possible to the associated pins. Care should also be taken to limit the serial inductance of the $V_{DD\_HV\_REG}$, BCTRL and $V_{DD\_LV\_CORx}$ pins to less than

L_{Reg}, see *Table 17*.

Note: The voltage regulator output cannot be used to drive external circuits. Output pins are used only for decoupling capacitances.

$V_{DD\_LV\_COR}$ must be generated using internal regulator and external NPN transistor. It is not possible to provide $V_{DD\_LV\_COR}$ through external regulator.

For the SPC560P44Lx, SPC560P50Lx microcontroller, capacitors, with total values not below C_{DEC1}, should be placed between $V_{DD\_LV\_CORx}/V_{SS\_LV\_CORx}$ close to external ballast transistor emitter. 4 capacitors, with total values not below C_{DEC2}, should be placed close to microcontroller pins between each $V_{DD\_LV\_CORx}/V_{SS\_LV\_CORx}$ supply pairs and the $V_{DD\_LV\_REGCOR}/V_{SS\_LV\_REGCOR}$ pair . Additionally, capacitors with total values not below C_{DEC3}, should be placed between the $V_{DD\_HV\_REG}/V_{SS\_HV\_REG}$ pins close to ballast collector. Capacitors values have to take into account capacitor accuracy, aging and variation versus temperature.

All reported information are valid for voltage and temperature ranges described in recommended operating condition, *Table 10* and *Table 11*.

3.8.2 Voltage monitor electrical characteristics

The device implements a Power-on Reset module to ensure correct power-up initialization, as well as three low voltage detectors to monitor the V_{DD} and the V_{DD_LV} voltage while device is supplied:

- POR monitors V_{DD} during the power-up phase to ensure device is maintained in a safe reset state
- LVDHV3 monitors V_{DD} to ensure device reset below minimum functional supply
- LVDHV5 monitors V_{DD} when application uses device in the 5.0 V ± 10 % range
- LVDLVCOR monitors low voltage digital power domain

3.9 Power up/down sequencing

To prevent an overstress event or a malfunction within and outside the device, the SPC560P44Lx, SPC560P50Lx implements the following sequence to ensure each module is started only when all conditions for switching it ON are available:

- A POWER_ON module working on voltage regulator supply controls the correct start-up of the regulator. This is a key module ensuring safe configuration for all voltage regulator functionality when supply is below 1.5V. Associated POWER_ON (or POR) signal is active low.
- Several low voltage detectors, working on voltage regulator supply monitor the voltage of the critical modules (voltage regulator, I/Os, flash memory and low voltage domain). LVDs are gated low when POWER_ON is active.
- A POWER_OK signal is generated when all critical supplies monitored by the LVD are available. This signal is active high and released to all modules including I/Os, flash

memory and RC16 oscillator needed during power-up phase and reset phase. When POWER_OK is low the associated module are set into a safe state.

3.10 DC electrical characteristics

3.10.1 NVUSRO register

Portions of the device configuration, such as high voltage supply, and watchdog enable/disable after reset are controlled via bit values in the non-volatile user options (NVUSRO) register.

For a detailed description of the NVUSRO register, please refer to the device reference manual.

NVUSRO[PAD3V5V] field description

The DC electrical characteristics are dependent on the PAD3V5V bit value. *Table 20* shows how NVUSRO[PAD3V5V] controls the device configuration.

3.10.5 I/O pad current specification

The I/O pads are distributed across the I/O supply segment. Each I/O supply segment is associated to a V_{DD}/V_{SS} supply pair as described in *Table 25*.

Table 25. I/O supply segment

Package	Supply segment

Table 26 provides the weight of concurrent switching I/Os.

In order to ensure device functionality, the sum of the weight of concurrent switching I/Os on a single segment should remain below 100%.

1. $V_{DD\_LV\_CORx}$ = 1.2 V ±10%; V_{SS} = 0 V; T_A = –40 to 125 °C, unless otherwise specified
2. Considering operation with PLL not bypassed
3. “Loss of Reference Frequency” window is the reference frequency range outside of which the PLL is in self-clocked mode.
4. Self-clocked mode frequency is the frequency that the PLL operates at when the reference frequency falls outside the f_{LOR} window.
5. f_{VCO} self clock range is 20–150 MHz. f_{SCM} represents f_{SYS} after PLL output divider (ERFD) of 2 through 16 in enhanced mode.
6. This value is determined by the crystal manufacturer and board design.
7. Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum f_{SYS}. Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the PLL circuitry via V_{DDPLL} and V_{SSPLL} and variation in crystal oscillator frequency increase the C_{JITTER} percentage for a given interval.
8. Proper PC board layout procedures must be followed to achieve specifications.
9. Values are with frequency modulation disabled. If frequency modulation is enabled, jitter is the sum of C_{JITTER} and either f_{CS} or f_{DS} (depending on whether center spread or down spread modulation is enabled).
10. Short term jitter is measured on the clock rising edge at cycle n and cycle n+4.
11. This value is determined by the crystal manufacturer and board design. For 4 MHz to 20 MHz crystals specified for this PLL, load capacitors should not exceed these limits.
12. This specification applies to the period required for the PLL to relock after changing the MFD frequency control bits in the synthesizer control register (SYNCR).
13. This value is true when operating at frequencies above 60 MHz, otherwise f_{CS} is 2% (above 64 MHz).
14. Modulation depth will be attenuated from depth setting when operating at modulation frequencies above 50 kHz.

3.14 Analog-to-digital converter (ADC) electrical characteristics

The device provides a 10-bit successive approximation register (SAR) analog-to-digital converter.

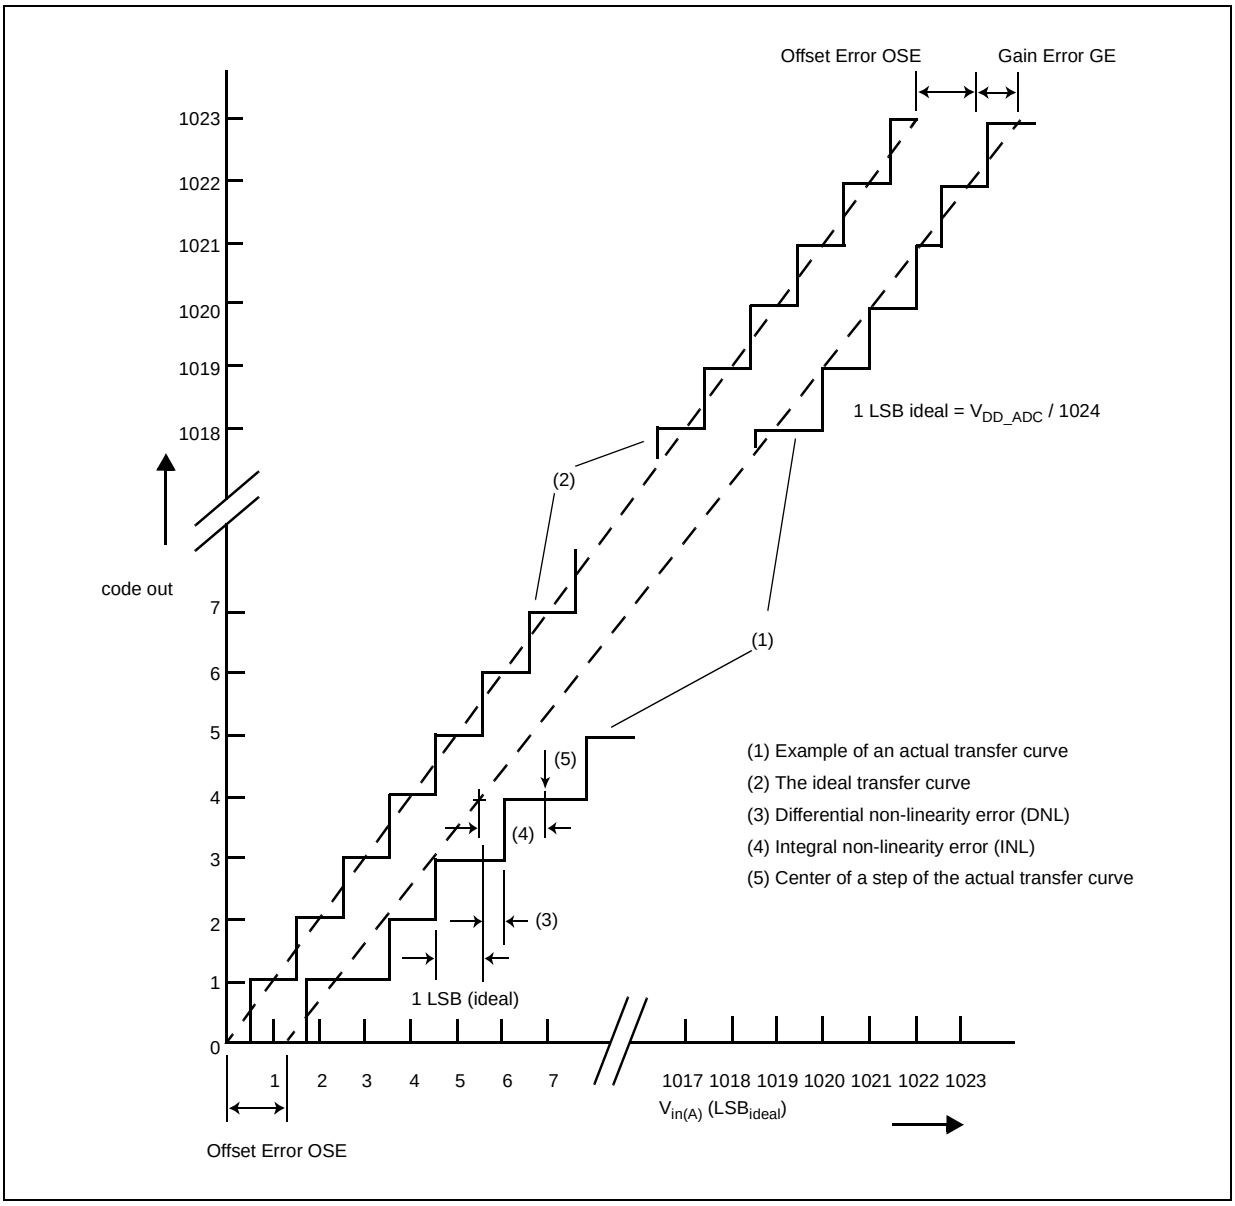

Figure 15. ADC characteristics and error definitions

3.14.1 Input impedance and ADC accuracy

To preserve the accuracy of the A/D converter, it is necessary that analog input pins have low AC impedance. Placing a capacitor with good high frequency characteristics at the input pin of the device can be effective: the capacitor should be as large as possible, ideally infinite. This capacitor contributes to attenuating the noise present on the input pin; further, it sources charge during the sampling phase, when the analog signal source is a high-impedance source.

A real filter can typically be obtained by using a series resistance with a capacitor on the input pin (simple RC filter). The RC filtering may be limited according to the source impedance value of the transducer or circuit supplying the analog signal to be measured.

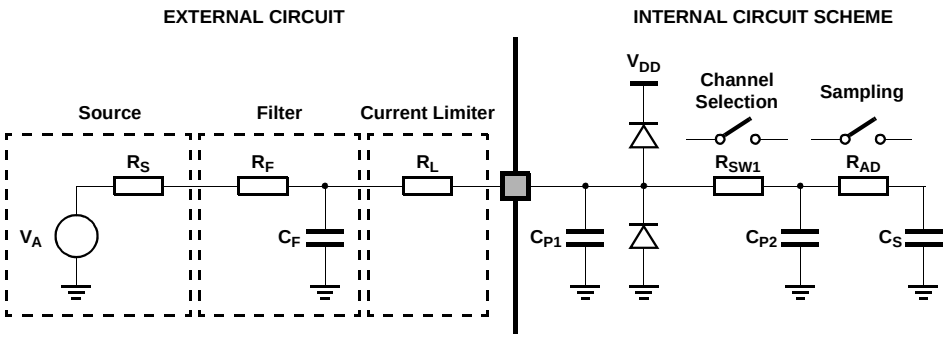
The filter at the input pins must be designed taking into account the dynamic characteristics of the input signal (bandwidth) and the equivalent input impedance of the ADC itself.

In fact a current sink contributor is represented by the charge sharing effects with the sampling capacitance: C_S and C_{P2} being substantially two switched capacitances, with a frequency equal to the ADC conversion rate, it can be seen as a resistive path to ground. For instance, assuming a conversion rate of 1 MHz, with C_S+C_{P2} equal to 3 pF, a resistance of 330 kΩ is obtained (R_{EQ} = 1 / (fc × (C_S+C_{P2})), where fc represents the conversion rate at the considered channel). To minimize the error induced by the voltage partitioning between this resistance (sampled voltage on C_S+C_{P2}) and the sum of R_S + R_F, the external circuit must be designed to respect the *Equation 4*:

Equation 4

$$V_A \bullet \frac{R_S + R_F}{R_{EQ}} < \frac{1}{2} LSB$$

Equation 4 generates a constraint for external network design, in particular on resistive path.



R_S: Source impedance
R_F: Filter resistance
C_F: Filter capacitance
R_L: Current limiter resistance
R_{SW1}: Channel selection switch impedance
R_{AD}: Sampling switch impedance
C_P: Pin capacitance (two contributions, C_{P1} and C_{P2})
C_S: Sampling capacitance

Figure 16. Input equivalent circuit

A second aspect involving the capacitance network shall be considered. Assuming the three capacitances C_F, C_{P1} and C_{P2} are initially charged at the source voltage V_A (refer to the equivalent circuit reported in *Figure 16*): A charge sharing phenomenon is installed when the sampling phase is started (A/D switch closed).

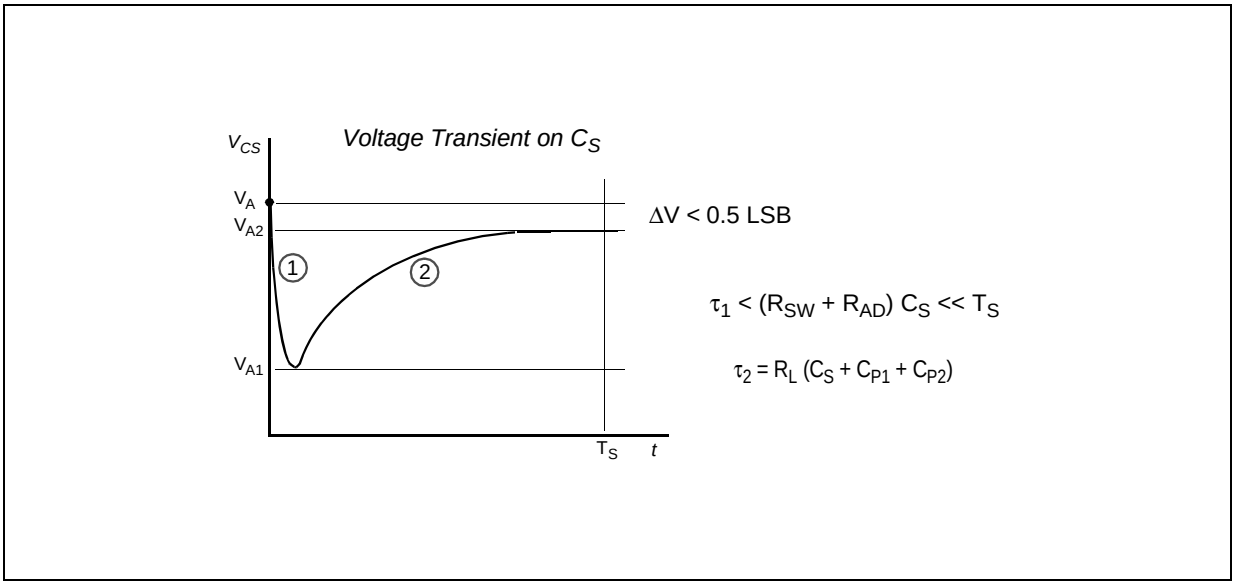


Figure 17. Transient behavior during sampling phase

In particular two different transient periods can be distinguished:

- A first and quick charge transfer from the internal capacitance C_{P1} and C_{P2} to the sampling capacitance C_S occurs (C_S is supposed initially completely discharged): considering a worst case (since the time constant in reality would be faster) in which C_{P2} is reported in parallel to C_{P1} (call $C_P = C_{P1} + C_{P2}$), the two capacitances C_P and C_S are in series, and the time constant is

Equation 5

$$\tau_1 = (R_{SW} + R_{AD}) \bullet \frac{C_P \bullet C_S}{C_P + C_S}$$

Equation 5 can again be simplified considering only C_S as an additional worst condition. In reality, the transient is faster, but the A/D converter circuitry has been designed to be robust also in the very worst case: the sampling time T_S is always much longer than the internal time constant:

Equation 6

$$\tau_1 < (R_{SW} + R_{AD}) \bullet C_S \ll T_S$$

The charge of C_{P1} and C_{P2} is redistributed also on C_S, determining a new value of the voltage V_{A1} on the capacitance according to *Equation 7*:

Equation 7

$$V_{A1} \bullet (C_S + C_{P1} + C_{P2}) = V_A \bullet (C_{P1} + C_{P2})$$

- A second charge transfer involves also C_F (that is typically bigger than the on-chip capacitance) through the resistance R_L: again considering the worst case in which C_{P2} and C_S were in parallel to C_{P1} (since the time constant in reality would be faster), the time constant is:

Equation 8

$$\tau_2 < R_L \bullet (C_S + C_{P1} + C_{P2})$$

In this case, the time constant depends on the external circuit: in particular imposing that the transient is completed well before the end of sampling time T_S, a constraints on R_L sizing is obtained:

Equation 9

$$8.5 \bullet \tau_2 = 8.5 \bullet R_L \bullet (C_S + C_{P1} + C_{P2}) < T_S$$

Of course, R_L shall be sized also according to the current limitation constraints, in combination with R_S (source impedance) and R_F (filter resistance). Being C_F definitively bigger than C_{P1}, C_{P2} and C_S, then the final voltage V_{A2} (at the end of the charge transfer transient) will be much higher than V_{A1}. *Equation 10* must be respected (charge balance assuming now C_S already charged at V_{A1}):

Equation 10

$$V_{A2} \bullet (C_S + C_{P1} + C_{P2} + C_F) = V_A \bullet C_F + V_{A1} \bullet (C_{P1} + C_{P2} + C_S)$$

The two transients above are not influenced by the voltage source that, due to the presence of the $R_F C_F$ filter, is not able to provide the extra charge to compensate the voltage drop on C_S with respect to the ideal source V_A; the time constant $R_F C_F$ of the filter is very high with respect to the sampling time (T_S). The filter is typically designed to act as anti-aliasing.

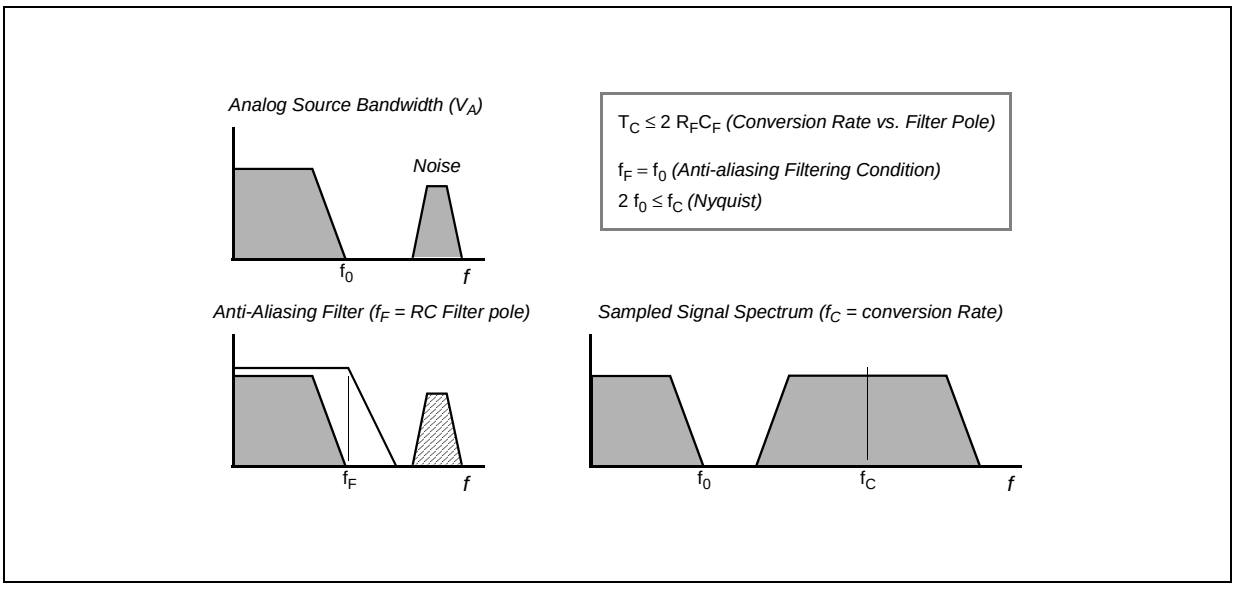

Figure 18. Spectral representation of input signal

Calling f_0 the bandwidth of the source signal (and as a consequence the cut-off frequency of the anti-aliasing filter, f_F), according to the Nyquist theorem the conversion rate f_C must be at least $2f_0$; it means that the constant time of the filter is greater than or at least equal to twice the conversion period (T_C). Again the conversion period T_C is longer than the sampling time T_S, which is just a portion of it, even when fixed channel continuous conversion mode is selected (fastest conversion rate at a specific channel): in conclusion it is evident that the time constant of the filter R_FC_F is definitively much higher than the sampling time T_S, so the charge level on C_S cannot be modified by the analog signal source during the time in which the sampling switch is closed.

The considerations above lead to impose new constraints on the external circuit, to reduce the accuracy error due to the voltage drop on C_S; from the two charge balance equations above, it is simple to derive *Equation 11* between the ideal and real sampled voltage on C_S:

Equation 11

$$\frac{V_A}{V_{A2}} = \frac{C_{P1} + C_{P2} + C_F}{C_{P1} + C_{P2} + C_F + C_S}$$

From this formula, in the worst case (when V_A is maximum, that is for instance 5 V), assuming to accept a maximum error of half a count, a constraint is evident on C_F value:

Equation 12

$$C_F > 2048 \bullet C_S$$

6. When configured to allow 60 MHz ADC, the minimum ADC clock speed is 9 MHz, below which precision is lost.
7. During the sample time the input capacitance CS can be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach its final voltage level within t_{ADC_S}. After the end of the sample time t_{ADC_S}, changes of the analog input voltage have no effect on the conversion result. Values for the sample clock t_{ADC_S} depend on programming.

2. Initial factory condition: < 100 program/erase cycles, 25 °C, typical supply voltage.
3. The maximum program and erase times occur after the specified number of program/erase cycles. These maximum values are characterized but not guaranteed.
4. Actual hardware programming times. This does not include software overhead.
5. Typical Bank programming time assumes that all cells are programmed in a single pulse. In reality some cells will require more than one pulse, adding a small overhead to total bank programming time (see Initial Max column).

Appendix A Abbreviations

Table 45 lists abbreviations used in this document.

Table 45. Abbreviations

Abbreviation	Meaning
CMOS	Complementary metal–oxide–semiconductor
CPHA	Clock phase
CPOL	Clock polarity
CS	Peripheral chip select
DUT	Device under test
ECC	Error code correction
EVTO	Event out
GPIO	General purpose input/output
MC	Modulus counter
MCKO	Message clock out
MCU	Microcontroller unit
MDO	Message data out
MSEO	Message start/end out
MTFE	Modified timing format enable
NPN	Negative-positive-negative
NVUSRO	Non-volatile user options register
PTF	Post trimming frequency
PWM	Pulse width modulation
RBW	Resolution bandwidth
SCK	Serial communications clock
SOUT	Serial data out
TCK	Test clock input
TDI	Test data input
TDO	Test data output
TMS	Test mode select

6 Revision history

Table 46 summarizes revisions to this document.

Table 46. Revision history

Date	Revision	Changes
28-Aug-2008	1	Initial release
25-Nov-2008	2	*Table 7*: TDO and TDI pins (Port pins B[4:5] are single function pins. *Table 12*, *Table 13*: Thermal characteristics added. *Table 11*, *Table 12*: EMI testing specifications split into separate tables for Normal mode and Airbag mode; data to be added in a later revision. *Table 16*, *Table 17*, *Table 19*, *Table 20*: Supply current specifications split into separate tables for Normal mode and Airbag mode; data to be added in a later revision. *Table 23*: ● Values for I_{OL} and I_{OH} (in Conditions column) changed. ● Max values for V_{OH_S}, V_{OH_M}, V_{OH_F} and V_{OH_SYM} deleted. ● V_{ILR} max value changed. ● I_{PUR} min and max values changed. *Table 27*: Sensitivity value changed. *Table 30*: Most values in table changed.
05-Mar-2009	3	● Description of system requirements, controller characteristics and how controller characteristics are guaranteed updated. ● Electrical parameters updated. ● EMI characteristics are now in one table; values have been updated. ● ESD characteristics are now in one table. ● Electrical parameters are identified as either system requirements or controller characteristics. Method used to guarantee each controller characteristic is noted in table. ● AC Timings: 1149.1 (JTAG) Timing, Nexus Timing, External Interrupt Timing, and DSPI Timing sections deleted

Table 46. Revision history (continued)

Date	Revision	Changes
07-Jul-2009	4	Through all document: – Replaced all “RESET_B” occurrences with “$\overline{\text{RESET}}$” through all document. – AC Timings: 1149.1 (JTAG) Timing, Nexus Timing, External Interrupt Timing, and DSPI Timing sections inserted again. – Electrical parameters updated. *Section , Features*: – Specified LIN 2.1 in communications interfaces feature. *Table 2* – Added row for Data Flash. *Table 4* – Added a footnote regarding the decoupling capacitors. *Table 6* – Removed the “other function“ column. – Rearranged the contents. *Table 14* – Updated definition of Condition column. *Table 19* – merged in an unique Table the power consumption data related to "Maximum mode" and "Airbag mode". *Table 21* – merged in an unique Table the power consumption data related to "Maximum mode" and "Airbag mode". *Table 29* – Updated the parameter definition of ΔRCMVAR. – Removed the condition definition of ΔRCMVAR. *Table 29* – Added t_{ADC_C} and TUE rows. *Table 30* – Added t_{ADC_C} and TUE rows. – Removed $R_{sw2.}$ *Table 33* – Added. *Table 29* – Updated and added footnotes. *Section 3.16.1 RESET Pin Characteristics* – Replaces whole section. *Table 38* – Renamed the “Flash (KB)“ heading column in “Code Flash / Data Flash (EE) (KB)“ – Replaced the value of RAM from 32 to 36KB in the last four rows.

Table 46. Revision history (continued)

Date	Revision	Changes
27-Oct-2009	5	- Added “Full Feature“ and “Airbag“ customization. - Removed B[4] and B[5] rows from “Pin muxing” table and inserted them on “System pins” table. - Updated package pinout. - Rewrote entirely section “Power Up/dpwn Sequencing“ section. - Renamend “$V_{DD\_LV\_PLL}$“ and “$V_{SS\_LV\_PLL}$“ supply pins with respectively “$V_{DD\_LV\_COR3}$“ and “$V_{SS\_LV\_COR3}$”. - Added explicative figures on “Electrical characteristics” section. - Updated “Thermal characteristics“ for 100-pin. - Proposed two different configuration of “voltage regulator. - Inserted Power Up/Down sequence. - Added explicative figures on “DC Electrical characteristics”. - Added “I/O pad current specification” section. - Renamed the “Airbag mode” with “Typical mode“and updated the values on “supply current” tables. - Added more order code.
06-Apr-2010	6	Inserted label of Y-axis in the “Independent ADC supply“ figure. “Recommended Operating Conditions” tables: Moved the T_J row to “Absolute Maximum Ratings“ table. Rewrite note 1 and 3 Inverted Min a Typ value of C_{DEC2} on ”Voltage Regulator Electrical Characteristics” table. Removed an useless duplicate of “Voltage Regulator Electrical Characteristics“ table. Inserted the name of C_S into “Input Equivalent Circuit“ figure. Removed leakage Ivpp from datasheet. Updated “Supply Current” tables. Added note on “Output pin transition times“ table. Updated ”Temperature Sensor Electrical Characteristics” table. Updated “16 MHz RC Oscillator Electrical Characteristics” table. Removed the note about the condition from “Flash read access timing“ table. Removed the notes that assert the values need to be confirmed before validation.
07-Apr-2011	7	Formatting and editorial changes throughout Removed all content referencing Junction Temperature Sensor Cover page Features: – CPU core—specified 64 MHz frequency – updated memory features – eTimer units: changed “up/down capabilities” to “up/down count capabilities” – ADC—changed “2 × 13 input channels” to “2 × 11 input channels, + 4 shared channels” – replaced “On-chip CAN/UART/FlexRay bootstrap loader” with “On-chip CAN/UART bootstrap loader” *Section 1: Introduction*: changed title (was: Overview); reorganized contents SPC560P44Lx, SPC560P50Lx device comparison: – ADC feature: changed “16 channels” to “15-channel”; added footnote to to indicate that four channels are shared between the two ADCs – removed SPC560P40 column – changed “dual channel” to “selectable single or dual channel support” in FlexRay footnote – updated “eTimer” feature – updated footnote relative to “Digital power supply” feature

Table 46. Revision history (continued)

Date	Revision	Changes
07-Apr-2011	7 (cont'd)	SPC560P44Lx, SPC560P50Lx device configuration differences: Removed "temperature" row (temperature information is provided in Order codes) Updated SPC560P44Lx, SPC560P50Lx block diagram Added SPC560P44Lx, SPC560P50Lx series block summary Added *Section 1.5 Feature details* *Section 2.1, Package pinouts*: removed alternate functions from pinout diagrams Supply pins: updated descriptions of power supply pins (1.2 V) System pins: updated table Pin muxing: added rows "B[4]" and "B[5] *Section 3.3, Absolute maximum ratings*: added voltage specifications to titles of *Figure 5* and *Figure 6*; in *Table 9*, changed row "V_{SS_HV} / Digital Ground" to "V_{SS} / Device Ground"; updated symbols *Section 3.4, Recommended operating conditions*: added voltage specifications to titles of *Figure 7* and *Figure 8* Recommended operating conditions (5.0 V), and Recommended operating conditions (3.3 V): changed row "V_{SS_HV} / Digital Ground" to "V_{SS} / Device Ground"; updated symbols Updated *Section 3.5.1, Package thermal characteristics* Updated *Section 3.6, Electromagnetic interference (EMI) characteristics* *Section 3.8.1, Voltage regulator electrical characteristics*: amended titles of *Table 16* and *Table 19* Voltage regulator electrical characteristics (configuration without resistor on base) and Voltage regulator electrical characteristics (configuration with resistor on base): updated symbol and values for $V_{DD\_LV\_REGCOR}$ Low voltage monitor electrical characteristics: Updated $V_{MLVDDOK\_H}$ max value—was 1.15 V; is 1.145 V *Section 3.10, DC electrical characteristics*: reorganized contents Updated *Section 3.10.1, NVUSRO register* (includes adding *Section NVUSRO[OSCILLATOR_MARGIN] field description*) Supply current (5.0 V, NVUSRO[PAD3V5V] = 0): updated symbols Corrected parameter descriptions in DC electrical characteristics (3.3 V, NVUSRO[PAD3V5V] = 1): – V_{OL_F}—was "Fast, high level output voltage"; is "Fast, low level output voltage" – V_{OL_SYM}—was "Symmetric, high level output voltage"; is "Symmetric, low level output voltage" Supply current (3.3 V, NVUSRO[PAD3V5V] = 1): updated symbols Main oscillator output electrical characteristics (5.0 V, NVUSRO[PAD3V5V] = 0): replaced instances of EXTAL with XTAL Main oscillator output electrical characteristics (3.3 V, NVUSRO[PAD3V5V] = 1): replaced instances of EXTAL with XTAL FMPLL electrical characteristics: replaced "PLLMRFM" with "FMPLL" in table title; updated conditions; removed f_{sys} row; updated $f_{FMPLLOUT}$ min value ADC conversion characteristics: updated symbols; added row t_{ADC_PU} Flash memory read access timing: added footnote to "Conditions" column *Section 3.16.1, Pad AC specifications*: added Pad output delay diagram In the range of figures "DSPI Classic SPI Timing — Master, CPHA = 0" to "DSPI PCS Strobe (PCSS) Timing": added note Updated Order codes Updated "Commercial product code structure" figure *Table 45*: Added abbreviations "DUT", "NPN", and "RBW"

Table 46. Revision history (continued)

Date	Revision	Changes
18-Jul-2012	8	Updated *Table 1 (Device summary)* *Section 1.5.4, Flash memory*: Changed “Data flash memory: 32-bit ECC” to “Data flash memory: 64-bit ECC” *Figure 40 (Commercial product code structure)*, replaced "C = 60 MHz, 5 V" and "D = 60 MHz, 3.3 V" with respectively "C = 40 MHz, 5 V" and "D = 40 MHz, 3.3 V" *Table 9 (Absolute maximum ratings)*, updated TV_{DD} parameter, the minimum value to 3.0 V/s and the maximum value to 0.5 V/µs *Table 7 (Pin muxing)*, changed the description in the column "I/O direction" from "I/O" to "O" for the following port pins: A[10] with function B[0] A[11] with function A[0] A[11] with function A[2] A[12] with function A[2] A[12] with function B[2] A[13] with function B[2] C[7] with function A[1] C[10] with function A[3] C[15] with function A[1] D[0] with function B[1] D[10] with function A[0] D[11] with function B[0] D[13] with function A[1] D[14] with function B[1] Updated *Section 3.8.1, Voltage regulator electrical characteristics* Added *Table 27 (I/O consumption)* *Section 3.10, DC electrical characteristics*: deleted references to “oscillator margin” deleted subsection “NVUSRO[OSCILLATOR_MARGIN] field description” *Table 21 (DC electrical characteristics (5.0 V, NVUSRO[PAD3V5V] = 0))*, added IPU row for $\overline{\text{RESET}}$ pin *Table 23 (DC electrical characteristics (3.3 V, NVUSRO[PAD3V5V] = 1))*, added IPU row for $\overline{\text{RESET}}$ pin *Table 33 (ADC conversion characteristics)*, added V_{INAN} entry Removed “Order codes” table *Figure 40 (Commercial product code structure)*: added a footnote updated “E = Data flash memory”

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits,General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
