

LTC2910

### FEATURES

- 8 Low Voltage Adjustable Inputs (0.5V)
- Guaranteed Threshold Accuracy: ±1.5V
- Input Glitch Rejection
- Pin Selectable Input Polarity Allows Negative and OV Monitoring
- Buffered 1V Reference Output
- Adjustable Reset Timeout with Timeout Disable
- 70µA Quiescent Current
- Open Drain RST and RST Outputs
- Guaranteed RST and  $\overline{RST}$  for  $V_{CC} \ge 1V$
- Available in 16-Lead SSOP and 16-Lead (5mm × 3mm) DFN Packages

### **APPLICATIONS**

- Desktop and Notebook Computers
- Network Servers
- Core, I/O Voltage Monitors

# Voltage Monitor

The LTC<sup>®</sup>2910 is an octal input voltage monitor intended for monitoring multiple voltages in a variety of applications. Each input has a nominal 0.5V threshold, featuring 1.5% tight threshold accuracy over the entire operating temperature range. Glitch filtering ensures reliable reset operation without false or noisy triggering.

Octal Positive/Negative

Polarity selection and a buffered reference allow monitoring up to two separate negative voltages. A three state input pin allows setting the polarity of two inputs without requiring any external components.

The LTC2910 provides a precise, versatile, space-conscious, micropower solution for voltage monitoring.

T, LT, LTC and LTM are registered trademarks of Linear Technology Corporation. All other trademarks are the property of their respective owners.

### TYPICAL APPLICATION

Octal Supply Monitor, 10% Tolerance, 12V, 5V (x2), 3.3V (x2), 2.5V, 1.8V, 1.2V

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: All currents into pins are positive; all voltages are referenced to GND unless otherwise noted.

Note 3: V<sub>CC</sub> maximum pin voltage is limited by input current. Since the V<sub>CC</sub> pin has an internal 6.5V shunt regulator, a low impedance supply that exceeds 6V may exceed the rated terminal current. Operation from higher voltage supplies requires a series dropping resistor. See Applications Information.

unless otherwise noted. (Note 2)

### TYPICAL PERFORMANCE CHARACTERISTICS

Specifications are at  $T_A = 25^{\circ}C$  and  $V_{CC} = 3.3V$ 

### **PIN FUNCTIONS**

DIS (Pin 13): Output Disable Input. Disables the RST and RST output pins. When DIS is pulled high, the RST and RST pins are not asserted except during a UVLO condition. Pin has a weak (2µA) internal pull-down to GND. Leave pin open if unused.

Exposed Pad (Pin 17, DFN Package): Exposed pad may be left open or connected to device ground.

#### GND (Pin 9): Device Ground

**REF (Pin 10):** Buffered Reference Output. 1V reference used for the offset of negative-monitoring applications. The buffered reference sources and sinks up to 1mA. The reference drives capacitive loads up to 1nF. Larger capacitive loads may cause instability. Leave pin open if unused.

RST (Pin 11): Open-Drain Reset Logic Output. Asserts high when any positive polarity input voltage is below threshold or any negative polarity input voltage is above threshold. Held high for an adjustable delay time after all voltage inputs are valid. Pin has a weak pull-up to  $V_{CC}$  and may be pulled above V<sub>CC</sub> using an external pull-up. Leave pin open if unused.

**RST** (Pin 12): Open-Drain Inverted Reset Logic Output. Asserts low when any positive polarity input voltage is below threshold or any negative polarity input voltage is above threshold. Held low for an adjustable delay time after all voltage inputs are valid. Pin has a weak pull-up to  $V_{CC}$ and may be pulled above  $V_{CC}$  using an external pull-up. Leave pin open if unused.

SEL (Pin 14): Input Polarity Select Three-State Input. Connect to V<sub>CC</sub>, GND or leave unconnected in open state to select one of three possible input polarity combinations (refer to Table 1).

TMR (Pin 15): Reset Delay Timer. Attach an external capacitor (C<sub>TMR</sub>) of at least 10pF to GND to set a reset delay time of 9ms/nF. A 1nF capacitor will generate an 8.5ms reset delay time. Tie pin to  $V_{CC}$  to bypass timer.

V1-V6 (Pin 1, 2, 3, 4, 5 & 6): Voltage Inputs 1 through 6. When the voltage on this pin is below 0.5V, a reset condition is triggered. Tie pin to  $V_{CC}$  if unused.

V7-V8 (Pin 7 & 8): Voltage Inputs 7 and 8. The polarity of the input is selected by the state of the SEL pin (refer

### PIN FUNCTIONS

to Table 1). When the monitored input is configured as a positive voltage, a reset condition is triggered when the pin is below 0.5V. When the monitored input is configured as a negative voltage, a reset condition is triggered when the pin is above 0.5V. Tie pin to  $V_{CC}$  if unused and configured as a positive supply. Tie pin to GND if unused and configured as a negative supply.

 $V_{CC}$  (Pin 16): Supply Voltage. Bypass this pin to GND with a 0.1µF (or greater) capacitor. Operates as a direct supply input for voltages up to 6V. Operates as a shunt regulator for supply voltages greater than 6V and must have a resistance between the pin and the supply to limit input current to no greater than 10mA. When used without a current-limiting resistance, pin voltage must not exceed 6V.

### **BLOCK DIAGRAM**

#### Voltage Monitoring

The LTC2910 is a low power octal voltage monitoring circuit with eight individual undervoltage monitor inputs. A timeout period that holds a reset after all faults have cleared is adjustable using an external capacitor and is disabled, by tying TMR to  $V_{CC}$ .

Each voltage monitor is compared to a fixed 0.5V reference for detecting undervoltage conditions. When configured to monitor a positive voltage  $V_m$ , the application is connected as shown in Figure 1. For negative inputs  $V_m$  is connected as shown in Figure 2.  $R_A$  is now connected to the REF pin and  $R_B$  remains connected to the monitored voltage  $V_m$ .

Using the configurations in Figures 1 and 2, a UV condition will result when the magnitude of the voltage at  $V_{\rm m}$  is less than its designed threshold.

#### **Polarity Selection**

The three-state polarity-select pin (SEL) selects one of three possible polarity combinations for the input thresholds, as described in Table 1. When an input is configured for negative supply monitoring, a reset condition occurs when the supply voltage is less negative than the configured threshold.

The three-state input pin SEL is connected to GND,  $V_{CC}$ , or left unconnected during normal operation. When the pin is left unconnected, the maximum leakage allowed from the pin is  $\pm 10\mu$ A to ensure it remains in the open state. Table 1 shows the three possible selections of polarity based on the SEL pin connection.

Figure 1. Positive UV Monitoring Configuration

_					
SEL	V7 INPUT	V8 INPUT			
V <sub>CC</sub>	Positive V7 < V <sub>RT</sub> → UV	Positive V8 < V <sub>RT</sub> → UV			
Open	Positive V7 < V <sub>RT</sub> → UV	Negative V8 > V <sub>RT</sub> → UV			
GND	Negative V7 > V <sub>RT</sub> → UV	Negative V8 > V <sub>RT</sub> → UV			

#### 2-Step Design Procedure

The following 2-step design procedure allows selecting appropriate resistances to obtain the desired UV trip point for the positive voltage monitor circuit in Figure 1 and the negative voltage monitor circuit in Figure 2.

For positive supply monitoring,  $V_m$  is the desired nominal operating voltage,  $I_m$  is the desired nominal current through the resistive divider, and  $V_{UV}$  is the desired undervoltage trip point.

For negative supply monitoring, to compensate for the 1V reference, 1V must be subtracted from  $V_m$  and  $V_{UV}$  before using each in the following equations.

#### 1. Choose $R_{\mbox{\scriptsize A}}$ to obtain the desired UV trip point

 $R_{\text{A}}$  is chosen to set the desired trip point for the undervoltage monitor.

$$R_{A} = \left| \frac{0.5V}{I_{m}} \bullet \frac{V_{m}}{V_{UV}} \right|$$
(1)

Figure 2. Negative UV Monitoring Configuration

#### 2. Choose $R_B$ to complete the design

Once R<sub>A</sub> is known, R<sub>B</sub> is determined by:

$$R_{\rm B} = \left| \frac{V_{\rm m}}{I_{\rm m}} \right| - R_{\rm A} \tag{2}$$

If any of the variables  $V_m,\,I_m,\,\text{or}\,\,V_{UV}$  change, then both steps must be recalculated.

#### **Positive Voltage Monitor Example**

A positive voltage monitor application is shown in Figure 3. The monitored voltage is a 5V  $\pm$ 10% supply. Nominal current in the resistive divider is 10µA.

1. Find R<sub>A</sub> to set the UV trip point of the monitor.

$$\mathsf{R}_{\mathsf{A}} = \left| \frac{0.5\mathsf{V}}{10\mu\mathsf{A}} \bullet \frac{5\mathsf{V}}{4.5\mathsf{V}} \right| \approx 56.2\mathsf{k}$$

2. Determine  $R_B$  to complete the design.

$$\mathsf{R}_{\mathsf{B}} = \left| \frac{5\mathsf{V}}{10\mu\mathsf{A}} \right| - 56.2\mathsf{k} \approx 499\mathsf{k}$$

#### **Negative Voltage Monitor Example**

A negative voltage monitor application is shown in Figure 4. The monitored voltage is a  $-5V \pm 10\%$  supply. Nominal

Figure 3. Positive Supply Monitor

current in the resistive divider is 10 $\mu A.$  For the negative case, 1V is subtracted from  $V_m$  and  $V_{UV}$ 

1. Find R<sub>A</sub> to set the UV trip point of the monitor.

$$R_{A} = \left| \frac{0.5V}{10\mu A} \bullet \frac{-5V - 1V}{-4.5V - 1V} \right| \approx 54.9k$$

2. Determine R<sub>B</sub> to complete the design.

$$R_{B} = \left| \frac{-5V - 1V}{10\mu A} \right| - 57.6k \approx 549k$$

#### Power-Up/Down

As soon as  $V_{CC}$  reaches 1V during power up, the RST output asserts low and the RST output weakly pulls to  $V_{CC}$ .

The LTC2910 is guaranteed to assert  $\overline{\text{RST}}$  low and RST high under conditions of low V<sub>CC</sub>, down to V<sub>CC</sub> = 1V. Above V<sub>CC</sub> = 2V (2.1V maximum) the Vn inputs take control.

Once all inputs and  $V_{CC}$  become valid, an internal timer is started. After an adjustable delay time, RST pulls low and RST weakly pulls high.

#### **Threshold Accuracy**

Reset threshold accuracy is important in a supply sensitive system. Ideally, such a system would reset only if supply

Figure 4. Negative Supply Monitor

voltages fell below the exact threshold for a specified margin. All LTC2910 inputs have a relative threshold accuracy of  $\pm 1.5\%$  over the full operating temperature range.

For example, when the LTC2910 is programmed to monitor a 5V input with a 10% tolerance, the desired UV trip point is 4.5V. Because of the  $\pm 1.5\%$  relative accuracy of the LTC2910, the UV trip point is between 4.433V and 4.567V which is 4.5V  $\pm 1.5\%$ .

The accuracy of the resistances chosen for  $R_A$  and  $R_B$  affect the UV trip point as well. Using the example just given, if the resistances used to set the UV trip point have 1% accuracy, the UV trip range is between 4.354V and 4.650V. This is illustrated in the following calculations.

The UV trip point is given as

$$V_{UV} = 0.5V \bullet \left(1 + \frac{R_B}{R_A}\right)$$

The two extreme conditions, with a relative accuracy of 1.5% and resistance accuracy of 1%, result in

$$V_{UV(MIN)} = 0.5V \bullet 0.985 \bullet \left(1 + \frac{R_B \bullet 0.99}{R_A \bullet 1.01}\right)$$

and

$$V_{UV(MAX)} = 0.5V \bullet 1.015 \bullet \left(1 + \frac{R_{B} \bullet 1.01}{R_{A} \bullet 0.99}\right)$$

For a desired trip point of 4.5V,  $\frac{R_B}{R_A} = 8$ 

Therefore,

$$V_{UV(MIN)} = 0.5V \cdot 0.985 \cdot \left(1 + 8 \cdot \frac{0.99}{1.01}\right) = 4.354V$$
  
and

$$V_{UV(MAX)} = 0.5V \bullet 1.015 \bullet \left(1 + 8 \bullet \frac{1.01}{0.99}\right) = 4.650V$$

### **Glitch Immunity**

In any supervisory application, noise riding on the monitored DC voltage causes spurious resets. To solve this problem without adding hysteresis, which causes a new error term in the trip voltage, the LTC2910 lowpass filters the output of the first stage comparator at each input. This filter integrates the output of the comparator before asserting the reset output logic. A transient at the input of the comparator of sufficient magnitude and duration triggers the output logic. The Typical Performance Characteristics section shows a graph of the Transient Duration vs. Comparator Overdrive.

### RST/RST Timing

The LTC2910 has an adjustable timeout period ( $t_{RST}$ ) that holds RST and  $\overline{RST}$  asserted after all faults have cleared. This assures a minimum reset pulse width allowing a settling time delay for the monitored voltage after it has entered the valid region of operation.

When any input drops below its designed threshold, the RST pin asserts low and the RST pin asserts high. When all inputs recover above their designed thresholds, the reset delay timer starts. If all inputs remain above their designed thresholds when the timer finishes, the RST pin weakly pulls high and the RST pin strongly pulls low. However, if any input falls below its designed threshold during this timeout period, the timer resets and restarts when all inputs are above the designed thresholds.

#### Selecting the Reset Timing Capacitor

The reset timeout period  $(t_{RST})$  for the LTC2910 is adjustable to accommodate a variety of applications. Connecting a capacitor,  $C_{TMR}$ , between the TMR pin and ground sets the timeout period. The value of capacitor needed for a particular timeout period is:

 $C_{TMR} = t_{RST} \bullet 115 \bullet 10^{-9} (F/s)$ 

The Reset Timeout Period vs. Capacitance graph found in the Typical Performance Characteristics section shows

the desired delay time as a function of the value of the timer capacitor. The TMR pin must have a minimum of 10pF or be tied to  $V_{CC}$ . For long timeout periods, the only limitation is the availability of a large value capacitor with low leakage. Capacitor leakage current must not exceed the minimum TMR charging current of 1.3µA. Tying the TMR pin to  $V_{CC}$  bypasses the timeout period.

#### **Undervoltage Lockout**

When  $V_{CC}$  falls below 2V, the LTC2910 asserts an undervoltage lockout (UVLO) condition. During UVLO, RST is asserted and pulled low and RST is pulled high. When  $V_{CC}$  rises above 2V, RST and RST follow the same timing procedure as an undervoltage condition on any input.

#### Shunt Regulator

The LTC2910 has an internal shunt regulator. The V<sub>CC</sub> pin operates as a direct supply input for voltages up to 6V. In this range, the quiescent current of the device remains below a maximum of 100 $\mu$ A. For V<sub>CC</sub> voltages higher than 6V, the pin functions as a shunt regulator and must have a resistance R<sub>Z</sub> between the supply and the V<sub>CC</sub> pin to limit the current to no greater than 10mA.

When selecting this resistance value, choose an appropriate location on the I-V curve shown in the Typical Performance Characteristics to accommodate any variations in  $V_{CC}$  due to changes in current through  $R_Z$ .

#### **RST/RST** Output Characteristics

The DC characteristics of the RST and  $\overline{\text{RST}}$  pull-up and pull-down strength are shown in the Typical Performance Characteristics. Each has a weak internal pull-up to V<sub>CC</sub> and a strong pull-down to ground. This arrangement allows each pin to have open-drain behavior while possessing several other beneficial characteristics. The weak pull-up eliminates the need for an external pull-up resistor when the rise time on this pin is not critical. On the other hand, the open drain configuration allows for wired-OR connections and is useful when more than one signal needs to pull down on the RST or RST lines. V<sub>CC</sub> of 1V guarantees a maximum V<sub>OL</sub> = 0.15V.

At  $V_{CC} = 1V$ , the weak pull-up current on RST is barely turned on. Therefore, an external pull-up resistor of no more than 100k is recommended on the RST pin if the state and pull-up strength of the RST pin is crucial at very low  $V_{CC}$ . Note however, by adding an external pull-up resistor, the pull-up strength on the RST pin is increased. Therefore, if it is connected in a wired-OR connection, the pull-down strength of any single device must accommodate this additional pull-up strength.

#### **Output Rise and Fall Time Estimation**

The RST and  $\overline{\text{RST}}$  outputs have strong pull-down capability. The following formula estimates the output fall time (90% to 10%) for a particular external load capacitance (C<sub>LOAD</sub>):

 $t_{FALL} \approx 2.2 \bullet R_{PD} \bullet C_{LOAD}$ 

where  $R_{PD}$  is the on-resistance of the internal pull-down transistor, typically 50 $\Omega$  at  $V_{CC}$  > 1V, and at room temperature (25°C).  $C_{LOAD}$  is the external load capacitance on the pin. Assuming a 150pF load capacitance, the fall time is 16.5ns.

The rise time on the RST and  $\overline{\text{RST}}$  pins is limited by a 400k internal pull-up resistance to V<sub>CC</sub>. A similar formula estimates the output rise time (10% to 90%) at the RST and  $\overline{\text{RST}}$  pins:

 $t_{RISE} \approx 2.2 \bullet R_{PU} \bullet C_{LOAD}$ 

where R<sub>PU</sub> is the pull-up resistance.

#### Disable

The LTC2910 allows disabling the RST and RST outputs via the DIS pin. Pulling DIS high forces both outputs to remain unasserted, regardless of any faults that occur on the inputs. However, if a UVLO condition occurs, RST asserts and pulls low, RST asserts and pulls high, but the timeout function is bypassed. RST pulls high and RST pulls low as soon as the UVLO condition is cleared.

DIS has a weak 2µA (typical) internal pull-down current guaranteeing normal operation with the pin left open.

### **TYPICAL APPLICATIONS**

Eight UV Supply Monitor, 10% Tolerance, 12V, 5V (x2), 3.3V (x2), 2.5V, 1.8V, 1.2V

Six Positive and Two Negative UV Supply Monitor, 10% Tolerance, 12V, 5V, 3.3V, 2.5V, 1.8V, 1.2V, –5V, –3.3V

### TYPICAL APPLICATIONS

Six UV and One OV/UV Supply Monitor, 10% Tolerance, 12V, 5V, 3.3V (x2), 2.5V, 1.8V, 1.2V

Six UV Supply Monitor Powered from 48V, 10% Tolerance, 48V, 5V, 3.3V, 2.5V, 1.8V, 1.2V

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
