LTC5544

## FGATURES

■ Conversion Gain: 7.4dB at 5250MHz

- IIP3: 25.9 dBm at 5250 MHz
- Noise Figure: 11.3 dB at 5250 MHz
- High Input P1dB
- IF Bandwidth Up to 1GHz
- 640mW Power Consumption
- Shutdown Pin
- $50 \Omega$ Single-Ended RF and LO Inputs
- +2dBm LO Drive Level
- High LO-RF and LO-IF Isolation
- $-40^{\circ} \mathrm{C}$ to $105^{\circ} \mathrm{C}$ Operation ( $\mathrm{T}_{\mathrm{C}}$ )
- Small Solution Size
- 16-Lead ( $4 \mathrm{~mm} \times 4 \mathrm{~mm}$ ) QFN package

## APPLICATIONS

- 5GHz WiMAX/WLAN Receiver
- 4.9GHz Public Safety Bands
- 4.9 GHz to 6 GHz Military Communications
- Point-to-Point Broadband Communications
- Radar Systems

DESCRIPTIOn

The LTC®5544 is part of a family of high dynamic range, high gain passive downconverting mixers covering the 600 MHz to 6GHz frequency range. The LTC5544 is optimized for 4 GHz to 6 GHz RF applications. The LO frequency must fall within the 4.2 GHz to 5.8 GHz range for optimum performance. A typical application is a WiMAX receiver with a 5.15 GHz to 5.35 GHz RF input and Iow side LO.
The LTC5544 is designed for 3.3V operation, however; the IF amplifier can be powered with 5V for the higher P1dB.
The LTC5544's high level of integration minimizes the total solution cost, board space and system-level variation, while providing the highest dynamic range for demanding receiver applications.

High Dynamic Range Downconverting Mixer Family

| PART\# | RF RANGE | LO RANGE |
| :---: | :---: | :---: |
| LTC5540 | 600 MHz to 1.3 GHz | 700 MHz to 1.2 GHz |
| LTC5541 | 1.3 GHz to 2.3 GHz | 1.4 GHz to 2.0 GHz |
| LTC5542 | 1.6 GHz to 2.7 GHz | 1.7 GHz to 2.5 GHz |
| LTC5543 | 2.3 GHz to 4 GHz | 2.4 GHz to 3.6 GHz |
| LTC5544 | 4 GHz to 6 GHz | 4.2 GHz to 5.8 GHz |

## TYPICAL APPLICATION

Wideband Conversion Gain, IIP3 and NF vs IF Output Frequency

ABSOLUTE MAXIMUM RATIOGS
(Note 1)
Mixer Supply Voltage (VCC1, $\mathrm{V}_{\text {CC2 }}$ ) ..... 4.0V
IF Supply Voltage ( IF $^{+}$, IF- ..... 5.5 V

GND (Pins 1, 8, 9, 11, Exposed Pad Pin 17): Ground. These pins must be soldered to the RF ground plane on the circuit board. The exposed pad metal of the package provides both electrical contact to ground and good thermal contact to the printed circuit board.

RF (Pin 2): Single-Ended Input for the RF Signal. This pin is internally connected to the primary side of the RF input transformer, which has low DC resistance to ground. A series DC-blocking capacitor should be used to avoid damage to the integrated transformer when DC voltage is present at the RF input. The RF input is impedance matched, as long as the LO input is driven with a 2 dBm $\pm 5 \mathrm{~dB}$ source between 4.2 GHz and 5.8 GHz .

CT (Pin 3): RF Transformer Secondary Center-Tap. This pin may require a bypass capacitor to ground. See the Applications Information section. This pin has an internally generated bias voltage of 1.2 V . It must be DC-isolated from ground and $\mathrm{V}_{\mathrm{CC}}$.
SHDN (Pin 4): Shutdown Pin. When the input voltage is less than 0.3 V , the IC is enabled. When the input voltage is greater than 3 V , the IC is disabled. Typical SHDN pin input current is less than $10 \mu \mathrm{~A}$. This pin must not be allowed to float.
$\mathbf{V}_{\text {CC1 }}$ (Pin 5) and $V_{\text {CC2 }}$ (Pin 7): Power Supply Pins for the LO Buffer and Bias Circuits. These pins are internally con-
nected and must be externally connected to a regulated 3.3V supply, with bypass capacitors located close to the pins. Typical current consumption is 96 mA .

LOBIAS (Pin 6): This Pin Allows Adjustment of the LO Buffer Current. Typical DC voltage is 2.2 V .

LO (Pin 10): Single-Ended Input for the Local Oscillator. This pin is internally connected to the primary side of the RF input transformer, which has low DC resistance to ground. A series DC blocking capacitor must be used to avoid damage to the integrated transformer if DC voltage is present at the LO input.

TEMP (Pin 12): Temperature Sensing Diode. This pin is connected to the anode of a diode that may be used to measure the die temperature, by forcing a current and measuring the voltage.

IFGND (Pin 13): DC Ground Return for the IF Amplifier. This pin must be connected to ground to complete the IF amplifier's DC current path. Typical DC current is 98 mA .
IF ${ }^{-}$(Pin 14) and IF ${ }^{+}$(Pin 15): Open-Collector Differential Outputs for the IFAmplifier. These pins must be connected to a DC supply through impedance matching inductors, or a transformer center-tap. Typical DC current consumption is 49 mA into each pin.
IFBIAS (Pin 16): This Pin Allows Adjustment of the IF Amplifier Current. Typical DC voltage is 2.1 V .

Figure 1. Standard Downmixer Test Circuit Schematic (240MHz IF)

## APPLICATIONS InFORMATION

## Introduction

The LTC5544 consists of a high linearity passive doublebalanced mixer core, IF buffer amplifier, LO buffer amplifier and bias/shutdown circuits. See the Block Diagram section for a description of each pin function. The RF and LO inputs are single-ended. The IF output is differential. Low side or high side LO injection can be used. The evaluation circuit, shown in Figure 1, utilizes bandpass IF output matching and an IF transformer to realize a $50 \Omega$ single-ended IF output. The evaluation board layout is shown in Figure 2.

Figure 2. Evaluation Board Layout

## RF Input

The mixer's RF input, shown in Figure 3, is connected to the primary winding of an integrated transformer. A $50 \Omega$ match is realized with a series capacitor (C1) and a shunt inductor (L4). The primary side of the RF transformer is DC-grounded internally and the DC resistance of the primary is approximately $2.4 \Omega$. A DC blocking capacitor is needed if the RF source has DC voltage present.
The secondary winding of the RF transformer is internally connected to the passive mixer. The center-tap of the transformer secondary is connected to Pin 3 (CT) to allow the connection of bypass capacitor, C 2 . The value of C 2 is LO frequency-dependent and can be tuned for better LO leakage performance. When used, C2 should be located within 2 mm of Pin 3 for proper high frequency decoupling. The nominal DC voltage on the CT pin is 1.2 V .

For the RF input to be matched, the LO input must be driven. A broadband input match is realized with $\mathrm{C} 1=0.6 \mathrm{pF}$ and $\mathrm{L} 4=2.2 \mathrm{nH}$. The measured RF input return loss is shown in Figure 4 for LO frequencies of 4.4 GHz , 5 GHz and 5.6 GHz . These LO frequencies correspond to the lower, middle and upper values of the LO range. As shown in Figure 4, the RF input impedance is somewhat dependent on LO frequency.

The RF input impedance and input reflection coefficient, versus RF frequency, is listed in Table 1. The reference plane for this data is Pin 2 of the IC, with no external matching, and the LO is driven at 5 GHz .

Figure 3. RF Input Schematic

Figure 4. RF Input Return Loss

## LO Input

The mixer's LO input circuit, shown in Figure 5, consists of a balun transformer and a two-stage high speed limiting differential amplifier to drive the mixer core. The LTC5544's LO amplifiers are optimized for the 4.2 GHz to 5.8 GHz LO frequency range. LO frequencies above or below this frequency range may be used with degraded performance.
The mixer's LO input is directly connected to the primary winding of an integrated transformer. A $50 \Omega$ match is realized with a series 1.2 pF capacitor (C3). Measured LO input return loss is shown in Figure 6.
The LO amplifiers are powered through $\mathrm{V}_{\mathrm{CC} 1}$ and $\mathrm{V}_{\mathrm{CC}}$ (Pin 5 and Pin 7). When the chip is enabled (SHDN =
low), the internal bias circuit provides a regulated 4 mA current to the amplifier's bias input, which in turn causes the amplifiers to draw approximately 90 mA of DC current. This 4 mA reference current is also connected to LOBIAS (Pin 6) to allow modification of the amplifier's DC bias current for special applications. The recommended application circuits require no LO amplifier bias modification, so this pin should be left open-circuited.

The nominal LO input level is +2 dBm although the limiting amplifiers will deliver excellent performance over a $\pm 3 \mathrm{~dB}$ input power range. LO input power greater than +5 dBm may be used with slightly degraded performance.

The LO input impedance and input reflection coefficient, versus frequency, is shown in Table 2.

Table 2. LO Input Impedance vs Frequency
(at Pin 10, No External Matching)

## APPLICATIONS InFORMATION

## IF Output

The IF amplifier, shown in Figure 7, has differential open-collector outputs ( $\mathrm{IF}^{+}$and $\mathrm{IF}^{-}$), a DC ground return pin (IFGND), and a pin for modifying the internal bias (IFBIAS). The IF outputs must be biased at the supply voltage ( $\mathrm{V}_{\text {CIIF }}$ ), which is applied through matching inductors L1 and L2. Alternatively, the IF outputs can be biased through the center tap of a transformer. The common node of L1 and L2 can be connected to the center tap of the transformer. Each IF output pin draws approximately 49 mA of DC supply current ( 98 mA total). IFGND (Pin 13) must be grounded or the amplifier will not draw DC current. For the highest conversion gain, high-Q wire-wound chip inductors are recommended for L1 and L2, especially when using $\mathrm{V}_{\text {CCIF }}=3.3 \mathrm{~V}$. Low cost multilayer chip inductors may be substituted, with a slight degradation in performance. Grounding through inductor L3 may improve LO-IF and RF-IF leakage performance in some applications, but is otherwise not necessary. High DC resistance in L3 will reduce the IF amplifier supply current, which will degrade RF performance.

Figure 7. IF Amplifier Schematic with Transformer-Based Bandpass Match

For optimum single-ended performance, the differential IF outputs must be combined through an external IF transformer or discrete IF balun circuit. The evaluation board (see Figures 1 and 2) uses a $4: 1$ ratio IF transformer for impedance transformation and differential to single-ended
transformation. It is also possible to eliminate the IF transformer and drive differential filters or amplifiers directly.
The IF output impedance can be modeled as $332 \Omega$ in parallel with 1.7 pF at IF frequencies. An equivalent smallsignal model is shown in Figure 8. Frequency-dependent differential IF output impedance is listed in Table 3. This data is referenced to the package pins (with no external components) and includes the effects of IC and package parasitics.

Figure 8. IF Output Small-Signal Model

Table 3. IF Output Impedance vs Frequency

| FREQUENCY (MHz) | DIFFERENTIAL OUTPUT <br> IMPEDANCE $\left(\mathbf{R}_{\text {IF }} \\| \mathbf{X I F}_{\text {IF }}\left(\mathbf{C}_{\text {IF }}\right)\right)$ |
| :---: | :---: |

| 240 | $332 \\|-\mathrm{j} 390(1.7 \mathrm{pF})$ |
| 300 | $325 \\|-\mathrm{j} 312(1.7 \mathrm{pF})$ |
| 380 | $318 \\|-\mathrm{j} 246(1.7 \mathrm{pF})$ |
| 456 | $304 \\|-\mathrm{j} 205(1.7 \mathrm{pF})$ |

## Transformer-Based Bandpass IF Matching

The IF output can be matched for IF frequencies as low as 40 MHz , or as high as 500 MHz , using the bandpass IF matching shown in Figures 1 and 7. L1 and L2 resonate with the internal IF output capacitance at the desired IF frequency. The value of $\mathrm{L} 1, \mathrm{~L} 2$ is calculated as follows:

$$
L 1, L 2=1 /\left[\left(2 \pi f_{I F}\right)^{2} \cdot 2 \cdot C_{I F}\right]
$$

where $\mathrm{C}_{\text {IF }}$ is the internal IF capacitance (listed in Table 3).
Values of L1 and L2 are tabulated in Figure 1 for various IF frequencies

## APPLICATIONS INFORMATION

## Discrete IF Balun Matching

For many applications, it is possible to replace the IF transformer with the discrete IF balun shown in Figure 9. The values of $\mathrm{L} 5, \mathrm{~L} 6, \mathrm{C} 13$ and C 14 are calculated to realize a $180^{\circ}$ phase shift at the desired IF frequency and provide a $50 \Omega$ single-ended output, using the following equations. Inductor L7 is used to cancel the internal capacitance $\mathrm{C}_{\mathrm{IF}}$ and supplies bias voltage to the IF pin. C15 is a DC blocking capacitor.

$$
\begin{aligned}
& \mathrm{L} 5, \mathrm{~L} 6=\frac{\sqrt{\mathrm{R}_{\mathrm{IF}} \cdot \mathrm{R}_{\text {OUT }}}}{\omega_{\mathrm{IF}}} \\
& \mathrm{C} 13, \mathrm{C} 14=\frac{1}{\omega_{\mathrm{IF}} \cdot \sqrt{\mathrm{R}_{\mathrm{IF}} \bullet \mathrm{R}_{\text {OUT }}}} \\
& \mathrm{L} 7=\frac{\left|\mathrm{X}_{\mathrm{IF}}\right|}{\omega_{\mathrm{IF}}}
\end{aligned}
$$

These equations give a good starting point, but it is usually necessary to adjust the component values after building and testing the circuit. The final solution can be achieved with less iteration by considering the parasitics of $L 7$ in the previous calculation.

The typical performances of the LTC5544 using a discrete IF balun matching and a transformer-based IF matching are shown in Figure 10. With an IF frequency of 456 MHz , the actual components values for the discrete balun are:
$\mathrm{L} 5, \mathrm{~L} 6=36 \mathrm{nH}, \mathrm{L} 7=82 \mathrm{nH}$ and C13, C14 $=3.3 \mathrm{pF}$
Measured IF output return losses for transformer-based bandpass IF matching and discrete balun IF matching (456MHz IF frequency) are plotted in Figure 11. A discrete balun has less insertion loss than a balun transformer, but the IF bandwidth of a discrete balun is less than that of a transformer.

## IF Amplifier Bias

The IF amplifier delivers excellent performance with $V_{\text {CCIF }}=3.3 \mathrm{~V}$, which allows the $\mathrm{V}_{\text {CC }}$ and $\mathrm{V}_{\text {CCIF }}$ supplies to be common. With $\mathrm{V}_{\text {CIIF }}$ increased to 5 V , the RF input P1dB increases by more than 3dB, at the expense of higher power consumption. Mixer performance at 5250 MHz is shown in Table 4 with $\mathrm{V}_{\text {CCIF }}=3.3 \mathrm{~V}$ and 5 V .

Table 4. Performance Comparison with $\mathrm{V}_{\text {CCIF }}=3.3 \mathrm{~V}$ and 5 V ( $\mathrm{RF}=5250 \mathrm{MHz}$, Low Side LO, IF = 240MHz)

## APPLICATIONS InFORMATION

The IFBIAS pin (Pin 16) is available for reducing the DC current consumption of the IF amplifier, at the expense of reduced performance. This pin should be left open-circuited for optimum performance. The internal bias circuit produces a 4mA reference for the IF amplifier, which causes the amplifier to draw approximately 98mA. If resistor R1 is connected to Pin 16 as shown in Figure 6, a portion of the reference current can be shunted to ground, resulting in reduced IF amplifier current. For example, $\mathrm{R} 1=1 \mathrm{k} \Omega$ will shunt away 1.5 mA from Pin 16 and the IF amplifier current will be reduced by $40 \%$ to approximately 59 mA . The nominal, open-circuit DC voltage at Pin 16 is 2.1 V . Table 5 lists RF performance at 5250 MHz versus IF amplifier current.

Table 5. Mixer Performance with Reduced IF Amplifier Current ( $\mathrm{RF}=5250 \mathrm{MHz}$, Low Side LO, IF $=240 \mathrm{MHz}, \mathrm{V}_{\mathrm{CC}}=\mathrm{V}_{\text {CCIF }}=3.3 \mathrm{~V}$ )

| 1.0 | 59 | 5.8 | 22.6 | 11.3 | 12.4 |

## Shutdown Interface

Figure 12 shows a simplified schematic of the SHDN pin interface. To disable the chip, the SHDN voltage must be higher than 3.0V. If the shutdown function is not required, the SHDN pin should be connected directly to GND. The voltage at the SHDN pin should never exceed the power supply voltage ( $\mathrm{V}_{\mathrm{CC}}$ ) by more than 0.3 V . If this should occur, the supply current could be sourced through the ESD diode, potentially damaging the IC.
The SHDN pin must be pulled high or low. If left floating, then the on/off state of the IC will be indeterminate. If a three-state condition can exist at the SHDN pin, then a pull-up or pull-down resistor must be used.

Figure 12. Shutdown Input Circuit

## Temperature Diode

The LTC5544 provides an on-chip diode at Pin 12 (TEMP) for chip temperature measurement. Pin 12 is connected to the anode of an internal ESD diode with its cathode connected to internal ground. The chip temperature can be measured by injecting a constant DC current into Pin 12 and measuring its DC voltage. The voltage vs temperature coefficient of the diode is about $-1.73 \mathrm{mV} /{ }^{\circ} \mathrm{C}$ with $10 \mu \mathrm{~A}$ current injected into the TEMP pin. Figure 13 shows a typical temperature-voltage behavior when $10 \mu \mathrm{~A}$ and $80 \mu \mathrm{~A}$ currents are injected into Pin 12.

Figure 13. TEMP Diode Voltage vs Junction Temperature ( $\mathrm{T}_{\mathrm{J}}$ )

## Supply Voltage Ramping

Fast ramping of the supply voltage can cause a current glitch in the internal ESD protection circuits. Depending on the supply inductance, this could result in a supply voltage transient that exceeds the maximum rating. A supply voltage ramp time of greater than 1 ms is recommended.

## PACKAGE DESCRIPTION

Please refer to http://www.linear.com/designtools/packaging/ for the most recent package drawings.

UF Package
16-Lead Plastic QFN ( $4 \mathrm{~mm} \times 4 \mathrm{~mm}$ )
(Reference LTC DWG \# 05-08-1692)

RECOMMENDED SOLDER PAD PITCH AND DIMENSIONS

NOTE:

1. DRAWING CONFORMS TO JEDEC PACKAGE OUTLINE MO-220 VARIATION (WGGC)
2. DRAWING NOT TO SCALE
3. ALL DIMENSIONS ARE IN MILLIMETERS
4. DIMENSIONS OF EXPOSED PAD ON BOTTOM OF PACKAGE DO NOT INCLUDE

MOLD FLASH. MOLD FLASH, IF PRESENT, SHALL NOT EXCEED 0.15 mm ON ANY SIDE
5. EXPOSED PAD SHALL BE SOLDER PLATED
6. SHADED AREA IS ONLY A REFERENCE FOR PIN 1 LOCATION ON THE TOP AND BOTTOM OF PACKAGE

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits,General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
