

Description

Power-One offers a wide range of battery charger systems consisting of adapted power supplies and appropriate temperature sensors. The (lead-acid) batteries are charged according to the battery temperature and the properties of the battery cells. When the battery is fully charged, it is maintained at the float charge voltage, which represents the optimum point for maximum available energy and optimum life expectancy of the battery. It is essential to place the sensor as close to the battery as possible thus sensing the battery temperature.

The most suited sensor model is defined mainly by three parameters: The nominal battery voltage (e.g., 24 V or 48 V), the temperature coefficient of the cells (e.g., -3.0 mV/K), and the nominal floating charge voltage per cell at 20 °C (e.g., 2.27 V/cell). The latter two are specified in the data sheet of the battery.

The temperature sensors K can be used with all Power-One converters with the standard R input. This input allows the control of the output voltage, see fig. 1. The open R input exhibits a source voltage of 2.5 V with a source resistor of 4 k Ω .

The sensor can directly be connected to the R input and is powered from the battery voltage, as shown in fig. 2. The sensor supersedes the internal voltage control circuit of the converter and adjusts the output voltage exactly to what is needed for the battery.

Note: Some converters exhibit a current droop characteristic to ease the operation in parallel connection. If the temperature sensor K is connected to the R-input, it cancels the droop characteristic and impedes current sharing. We recommend the use of converters with true current sharing (option T).

Different models of battery sensors are available depending on the battery specifications. Table 1 gives an overview of available sensors.

Note: Other types for different cell voltages, temperature coefficients, and cable lengths are available on request.

For example, if the application uses a 48 V battery consisting of 24 cells of 2.27 V, a temperature coefficient of -3.0 mV/K, and 2 m cable length, the sensor type S-KSMH48-2.27-30-2 should be selected.

Fig. 3 shows the charge voltage depending on the temperature and the battery type. If the sensor is

disconnected, the converter output voltage is regulated to $V_{o\ safe}$. This voltage prevents the battery from being overcharged even at high temperature. Overcharging a battery is dangerous and can cause the battery to explode.

Fail Safe Operation

To prevent batteries from overcharging but still maintain a minimum charging in case of interruption of the sensor signal cable to the power supply, Power-One offers converters with a special nominal output voltage setting; see table 2. These converters differ from the respective standard models in the nominal output voltage and output current settings. Without the sensor connected to the R pin, the output voltage is set to $V_{o\ safe}$, which is higher than the nominal battery voltage such avoiding discharging the battery, but still lower than the theoretically needed float

¹ Both outputs connected in series.

² Similar models with DC input (DS/LS1740, DS/LS2740) are available as well.

³ DC input; DK/LK1740, and DK/LK2740 are available as well.

charge voltage. As soon as the sensor is connected to the R pin, the output voltage will be set to the correct value. This is essential for best energy and battery life time.

Other Power-One converters may also be used for battery charging controlled by the temperature sensor. However, the output voltage at low temperature might not be reached. If the sensor is used only for decreasing the output voltage, for instance, if using a 15 V power supply to charge a 12 V battery, then disconnecting the sensor results in a dangerous situation. We recommend to add a resistor between the R input and its reference, which adjusts the output voltage with disconnected sensor to $V_{o\ safe}$. This is shown in fig. 5.

Converters with DC Input

Most of the models listed in table 2 have an AC input. However, there are applications requiring battery charging from a DC source – sometimes even without electrical isolation.

For this purpose, DC-DC converters of Q, P, M, S, or K Series may be used, such as all switching regulators, provided that they exhibit the standard R input.

For safe operation, we recommend to provide a resistor R_{safe} with the correct value (see fig. 5).

Mechanical Dimensions

All dimensions in mm.

S-KSMH temperature sensor.

Temperature Sensors for the T Series

T Series battery chargers exhibit a cell voltage selector switch to set the required floating charge voltage directly at

the converter. A special temperature sensor T matches to the T Series. All details are provided in the T Series data sheet at Power-One's web site; see www.power-one.com.

NUCLEAR AND MEDICAL APPLICATIONS - Power-One products are not designed, intended for use in, or authorized for use as critical components in life support systems, equipment used in hazardous environments, or nuclear control systems without the express written consent of the respective divisional president of Power-One, Inc.

TECHNICAL REVISIONS - The appearance of products, including safety agency certifications pictured on labels, may change depending on the date manufactured. Specifications are subject to change without notice.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
