### **Features**

- Fast Read Access Time 70 ns
- 5-volt Only Reprogramming
- Sector Program Operation
  - Single Cycle Reprogram (Erase and Program)
  - 512 Sectors (128 Bytes/Sector)
  - Internal Address and Data Latches for 128 Bytes
- Internal Program Control and Timer
- Hardware and Software Data Protection
- Fast Sector Program Cycle Time 10 ms
- DATA Polling for End of Program Detection
- Low Power Dissipation
  - 50 mA Active Current
  - 100 µA CMOS Standby Current
- Typical Endurance > 10,000 Cycles
- Single 5V ± 10% Supply
- CMOS and TTL Compatible Inputs and Outputs
- Commercial and Industrial Temperature Ranges
- · Green (Pb/Halide-free) Packaging Option

### 1. Description

The AT29C512 is a 5-volt only in-system Flash programmable and erasable read only memory (PEROM). Its 512K of memory is organized as 65,536 words by 8 bits. Manufactured with Atmel's advanced nonvolatile CMOS technology, the device offers access times to 70 ns with power dissipation of just 275 mW over the commercial temperature range. When the device is deselected, the CMOS standby current is less than 100  $\mu$ A. The device endurance is such that any sector can typically be written to in excess of 10,000 times.

To allow for simple in-system reprogrammability, the AT29C512 does not require high input voltages for programming. Five-volt-only commands determine the operation of the device. Reading data out of the device is similar to reading from an EPROM. Reprogramming the AT29C512 is performed on a sector basis; 128 bytes of data are loaded into the device and then simultaneously programmed.

During a reprogram cycle, the address locations and 128 bytes of data are internally latched, freeing the address and data bus for other operations. Following the initiation of a program cycle, the device will automatically erase the sector and then program the latched data using an internal control timer. The end of a program cycle can be detected by  $\overline{DATA}$  polling of I/O7. Once the end of a program cycle has been detected, a new access for a read or program can begin.

512K (64K x 8) 5-volt Only Flash Memory

AT29C512

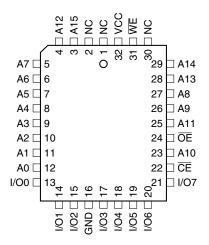

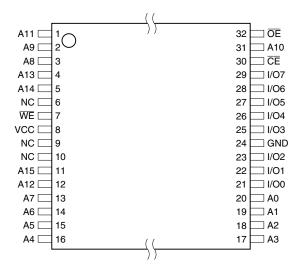

## 2. Pin Configurations

Pin Name	Function
A0 - A15	Addresses
CE	Chip Enable
ŌĒ	Output Enable
WE	Write Enable
I/O0 - I/O7	Data Inputs/Outputs
NC	No Connect

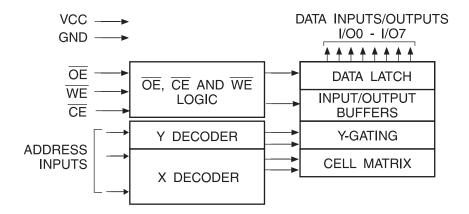

## 2.1 32-lead PLCC Top View

### 2.2 32-lead TSOP (Type 1) Top View

### 3. Block Diagram

### 4. Device Operation

### 4.1 Read

The AT29C512 is accessed like an EPROM. When  $\overline{\text{CE}}$  and  $\overline{\text{OE}}$  are low and  $\overline{\text{WE}}$  is high, the data stored at the memory location determined by the address pins is asserted on the outputs. The outputs are put in the high impedance state whenever  $\overline{\text{CE}}$  or  $\overline{\text{OE}}$  is high. This dual-line control gives designers flexibility in preventing bus contention.

### 4.2 Byte Load

Byte loads are used to enter the 128 bytes of a sector to be programmed or the software codes for data protection. A byte load is performed by applying a low pulse on the  $\overline{\text{WE}}$  or  $\overline{\text{CE}}$  input with  $\overline{\text{CE}}$  or  $\overline{\text{WE}}$  low (respectively) and  $\overline{\text{OE}}$  high. The address is latched on the falling edge of  $\overline{\text{CE}}$  or  $\overline{\text{WE}}$ , whichever occurs last. The data is latched by the first rising edge of  $\overline{\text{CE}}$  or  $\overline{\text{WE}}$ .

### 4.3 Program

The device is reprogrammed on a sector basis. If a byte of data within a sector is to be changed, data for the entire sector must be loaded into the device. Any byte that is not loaded during the programming of its sector will be indeterminate. Once the bytes of a sector are loaded into the device, they are simultaneously programmed during the internal programming period. After the first data byte has been loaded into the device, successive bytes are entered in the same manner. Each new byte to be programmed must have its high-to-low transition on  $\overline{\text{WE}}$  (or  $\overline{\text{CE}}$ ) within 150 µs of the low-to-high transition of  $\overline{\text{WE}}$  (or  $\overline{\text{CE}}$ ) of the preceding byte. If a high-to-low transition is not detected within 150 µs of the last low-to-high transition, the load period will end and the internal programming period will start. A7 to A15 specify the sector address. The sector address must be valid during each high-to-low transition of  $\overline{\text{WE}}$  (or  $\overline{\text{CE}}$ ). A0 to A6 specify the byte address within the sector. The bytes may be loaded in any order; sequential loading is not required. Once a programming operation has been initiated, and for the duration of  $t_{\text{WC}}$ , a read operation will effectively be a polling operation.

### 4.4 Software Data Protection

A software controlled data protection feature is available on the AT29C512. Once the software protection is enabled a software algorithm must be issued to the device before a program may be performed. The software protection feature may be enabled or disabled by the user; when shipped from Atmel, the software data protection feature is disabled. To enable the software data protection, a series of three program commands to specific addresses with specific data must be performed. After the software data protection is enabled the same three program commands must begin each program cycle in order for the programs to occur. All software program commands must obey the sector program timing specifications. Once set, the software data protection feature remains active unless its disable command is issued. Power transitions will not reset the software data protection feature; however, the software feature will guard against inadvertent program cycles during power transitions.

Once set, software data protection will remain active unless the disable command sequence is issued.

After setting SDP, any attempt to write to the device without the 3-byte command sequence will start the internal write timers. No data will be written to the device; however, for the duration of  $t_{WC}$ , a read operation will effectively be a polling operation.

After the software data protection's 3-byte command code is given, a byte load is performed by applying a low pulse on the  $\overline{\text{WE}}$  or  $\overline{\text{CE}}$  input with  $\overline{\text{CE}}$  or  $\overline{\text{WE}}$  low (respectively) and  $\overline{\text{OE}}$  high. The address is latched on the falling edge of  $\overline{\text{CE}}$  or  $\overline{\text{WE}}$ , whichever occurs last. The data is latched by the first rising edge of  $\overline{\text{CE}}$  or  $\overline{\text{WE}}$ . The 128 bytes of data must be loaded into each sector by the same procedure as outlined in the program section under device operation.

### 4.5 Hardware Data Protection

Hardware features protect against inadvertent programs to the AT29C512 in the following ways: (a)  $V_{CC}$  sense – if  $V_{CC}$  is below 3.8V (typical), the program function is inhibited; (b)  $V_{CC}$  power on delay – once  $V_{CC}$  has reached the  $V_{CC}$  sense level, the device will automatically time out 5 ms (typical) before programming; (c) Program inhibit – holding any one of  $\overline{OE}$  low,  $\overline{CE}$  high or  $\overline{WE}$  high inhibits program cycles; and (d) Noise filter – pulses of less than 15 ns (typical) on the  $\overline{WE}$  or  $\overline{CE}$  inputs will not initiate a program cycle.

### 4.6 Product Identification

The product identification mode identifies the device and manufacturer as Atmel. It may be accessed by hardware or software operation. The hardware operation mode can be used by an external programmer to identify the correct programming algorithm for the Atmel product. In addition, users may wish to use the software product identification mode to identify the part (i.e., using the device code), and have the system software use the appropriate sector size for program operations. In this manner, the user can have a common board design for 256K to 4-megabit densities and, with each density's sector size in a memory map, have the system software apply the appropriate sector size.

For details, see Operating Modes (for hardware operation) or Software Product Identification. The manufacturer and device code is the same for both modes.

### 4.7 DATA Polling

The AT29C512 features DATA polling to indicate the end of a program cycle. During a program cycle an attempted read of the last byte loaded will result in the complement of the loaded data on I/O7. Once the program cycle has been completed, true data is valid on all outputs and the next cycle may begin. DATA polling may begin at any time during the program cycle.

### 4.8 Toggle Bit

In addition to DATA polling the AT29C512 provides another method for determining the end of a program or erase cycle. During a program or erase operation, successive attempts to read data from the device will result in I/O6 toggling between one and zero. Once the program cycle has completed, I/O6 will stop toggling and valid data will be read. Examining the toggle bit may begin at any time during a program cycle.

### 4.9 Optional Chip Erase Mode

The entire device can be erased by using a 6-byte software code. Please see Software Chip Erase application note for details.

## 5. Absolute Maximum Ratings\*

Temperature Under Bias55°C to +125°C
Storage Temperature65°C to +150°C
All Input Voltages (including NC Pins) with Respect to Ground0.6V to +6.25V
All Output Voltages with Respect to Ground0.6V to V <sub>CC</sub> + 0.6V
Voltage on $\overline{\text{OE}}$ with Respect to Ground0.6V to +13.5V

\*NOTICE:

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## 6. DC and AC Operating Range

t <sub>WP</sub>	Write Pulse Width	Pulse Width 90		ns
t <sub>BLC</sub>	Byte Load Cycle Time		150	μs
t <sub>WPH</sub>	Write Pulse Width High	100		ns

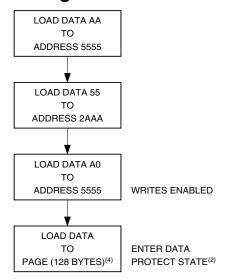

# 17. Program Cycle Waveforms<sup>(1)(2)(3)</sup>

Notes: 1. A7 through A15 must specify the sector address during each high-to-low transition of WE (or CE).

- 2.  $\overline{OE}$  must be high when  $\overline{WE}$  and  $\overline{CE}$  are both low.
- 3. All bytes that are not loaded within the sector being programmed will be indeterminate.

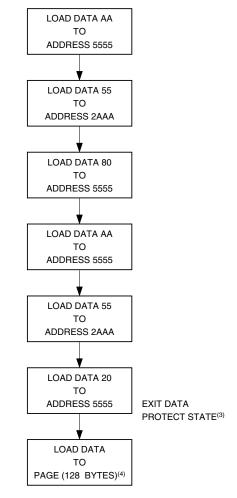

# 18. Software Data Protection Enable Algorithm<sup>(1)</sup>

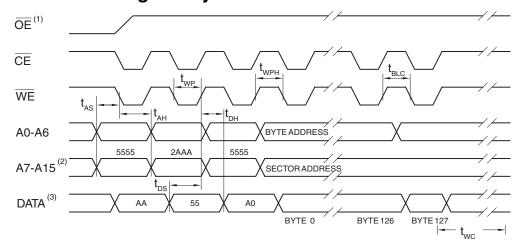

Notes: 1. Data Format: I/O7 - I/O0 (Hex);Address Format: A14 - A0 (Hex).

- Data Protect state will be activated at end of program cycle.
- Data Protect state will be deactivated at end of program period.
- 4. 128 bytes of data MUST BE loaded.

# 19. Software Data Protection Disable Algorithm<sup>(1)</sup>

# 20. Software Protected Program Cycle Waveform (1)(2)(3)

Notes: 1. A7 through A15 must specify the page address during each high-to-low transition of WE (or CE) after the software code has been entered.

- 2.  $\overline{OE}$  must be high when  $\overline{WE}$  and  $\overline{CE}$  are both low.
- 3. All bytes that are not loaded within the sector being programmed will be indeterminate.

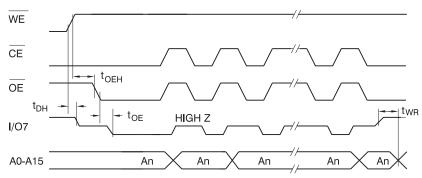

# 21. Data Polling Characteristics<sup>(1)</sup>

Symbol	Parameter	Min	Тур	Max	Units
t <sub>DH</sub>	Data Hold Time	10			ns
t <sub>OEH</sub>	OE Hold Time	10			ns
t <sub>OE</sub>	OE to Output Delay <sup>(2)</sup>				ns
t <sub>WR</sub>	Write Recovery Time	0			ns

Notes: 1. These parameters are characterized and not 100% tested.

2. See  $t_{\text{OE}}$  spec in AC Read Characteristics.

## 22. Data Polling Waveforms

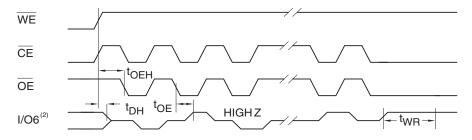

## 23. Toggle Bit Characteristics<sup>(1)</sup>

Symbol	Parameter	Min	Тур	Max	Units
t <sub>DH</sub>	Data Hold Time	10			ns
t <sub>OEH</sub>	OE Hold Time	10			ns
t <sub>OE</sub>	OE to Output Delay <sup>(2)</sup>				ns
t <sub>OEHP</sub>	OE High Pulse	150			ns
t <sub>WR</sub>	Write Recovery Time	0			ns

Notes: 1. These parameters are characterized and not 100% tested.

2. See t<sub>OE</sub> spec in AC Read Characteristics.

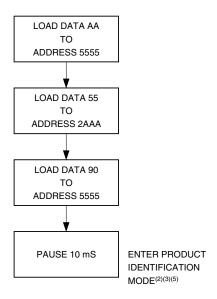

## 24. Toggle Bit Waveforms<sup>(1)(2)(3)</sup>

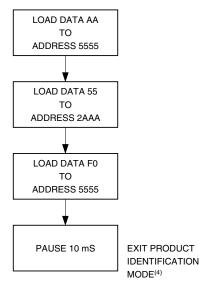

Notes: 1. Toggling either  $\overline{OE}$  or  $\overline{CE}$  or both  $\overline{OE}$  and  $\overline{CE}$  will operate toggle bit.

- 2. Beginning and ending state of I/O6 will vary.
- 3. Any address location may be used but the address should not vary.

# 25. Software Product Identification Entry<sup>(1)</sup>

## 26. Software Product Identification Exit<sup>(1)</sup>

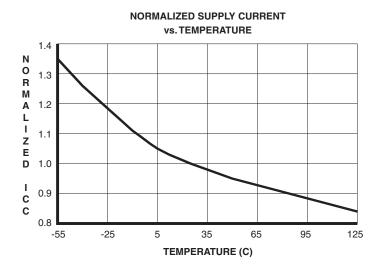

Notes: 1. Data Format: I/O7 - I/O0 (Hex); Address Format: A14 - A0 (Hex).

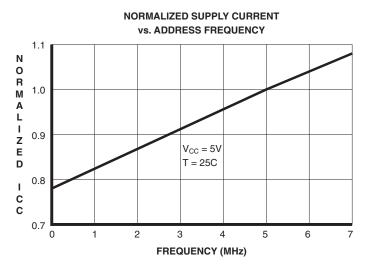

- 2. A1 A15 =  $V_{IL}$ . Manufacturer Code is read for A0 =  $V_{IL}$ ; Device Code is read for A0 =  $V_{IH}$ .
- 3. The device does not remain in identification mode if powered down.
- 4. The device returns to standard operation mode.
- 5. Manufacturer Code is 1F. The Device Code is 5D.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

### Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001:
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
