

# 1.25G ETHERNET MULTI-RATE 10/100/1000BASE-T COPPER SFP TRANSCEIVER

**TRPRG1VA1x000E2G**

## Product Description

TRPRG1VA1x000E2G Copper Small Form Pluggable (SFP) transceivers are high performance, cost effective and compliant with the Gigabit Ethernet and 1000BASE-T standards as specified in IEEE 802.3-2002 and IEEE 802.3ab.

The module has two interfaces: the host interface and the MDI interface. The MDI interface provides 1000Base-T connectivity over the Category-5 cable. The host interface provides the data transfer over the 1.25 GHz PECL differential interface to the host board and control and configuration functions through the serial management interface. The module supports 1000Mbps full duplex with 5-level Pulse Amplitude Modulation (PAM) signals. The default mode of operation after power-up is 1000Base-T, full duplex, over SERDES Interface. All four pairs in the cable are used with symbol rate at 250Mbps on each pair. The module provides standard serial ID information compliant with SFP MSA, which can be accessed with address of A0h via the 2-wire serial bus interface. The physical IC can also be accessed via 2-wire serial bus at address ACh.

The transceivers operate from a single +3.3V power supply over an operating case temperature range of 0°C to +70°C (Commercial), -40°C to +85°C (Industrial) or -5°C to +85°C (Extended). The housing is made of metal for EMI immunity.

### Application Notes

**Loss of Signal (LOS):** LVTTTL compatible with a maximum voltage of 2.5V. LOS pin can be enabled or disabled (Refer to Ordering information).

**TX\_Fault:** TX\_Fault pin is not supported, and is always connected to ground.

**TX\_Disable:** It is an input used to reset the transceiver module. This pin is pulled up within the module with a 4.7 K $\Omega$  resistor. Low (0 – 0.8 V): Transceiver on; Between 0.8 V and 2.0 V: Undefined; High (2.0 - 3.465 V): Transceiver in reset state; Open: Transceiver in reset state.

**Serial Identification and Monitoring:** The module definition of SFP is indicated by the three module definition pins, MOD\_DEF(0), MOD\_DEF(1) and MOD\_DEF(2).

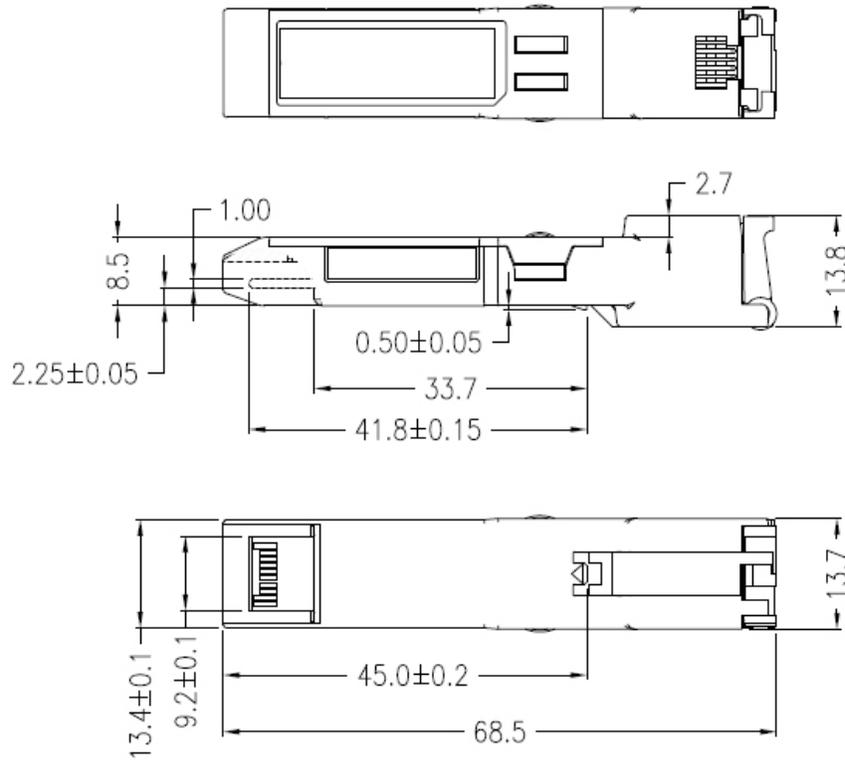

They should be pulled up with a 4.7K~10K resistor on the host board. The pull-up voltage shall be VccT or VccR. MOD\_DEF(0)

is grounded by the module to indicate that the module is present. MOD\_DEF(1) is the clock line of two wire serial interface for serial ID. MOD\_DEF(2) is the data line of two wire serial interface for serial ID.

**RD-/+:** These are the differential receiver outputs. They are AC coupled 100 differential lines which should be terminated with 100 (differential) at the user SERDES.

**TD-/+:** These are the differential transmitter inputs. They are AC-coupled, differential lines with 100 differential terminations inside the module.
