2-Series, 3-Series, and 4-Series Li-Ion Battery Pack Manager

Check for Samples: bq30z554-R1

FEATURES

- **Fully Integrated 2-Series, 3-Series, and 4-Series Li-Ion or Li-Polymer Cell Battery Pack Manager and Protection**
- **High Side N-CH Protection FET Drive**
- **Impedance Track™ Gas Gauging**
- **Integrated Cell Balancing While Charging or At Rest**
- **PF Snapshot and Black Box Technology Analyze Returned Packs**
- **AC Peak Power Information Capability (TURBO Mode)**
- **SBS v1.1 Interface**
- **Low Power Modes**
  - **Low Power: < 180 µA**
  - **Sleep < 76 µA**
- **Complete Set of Advanced Protections:**
  - **Internal Cell Short**
  - **Cell Imbalance**
  - **Cell Voltage**
  - **Overcurrent**
  - **Temperature**
  - **FET Protection**
- **Sophisticated Charge Algorithms**
  - **JEITA**
  - **Enhanced Charging**
  - **Adaptive Charging**
  - **Cell Balancing While Charging or At Rest**
- **General Purpose Output for Power Interrupt**
- **Diagnostic Lifetime Data Monitor**
- **SHA-1 Authentication**
- **Small Package: TSSOP**

APPLICATIONS

- **Notebook/Netbook PCs**
- **Medical and Test Equipment**
- **Portable Instrumentation**

DESCRIPTION

The bq30z554-R1 device is a fully integrated Impedance Track™ gas gauge and analog monitoring single-package solution that provides protection and monitoring with authentication for 2-series, 3-series, and 4-series cell Li-Ion battery packs. The bq30z554-R1 device incorporates sophisticated algorithms that offer cell balancing while charging or at rest.

The device communicates via an SBS v1.1 interface, providing high accuracy cell parameter reporting and control of battery pack operation, and can be designed into systems that require AC peak power (TURBO mode), using a method to ensure that system performance is not disrupted.

An optimum balance of quick response hardware-based protection along with intelligent CPU control delivers an ideal pack solution. The device has flexible user-programmable settings of critical system parameters, such as voltage, current, temperature, and cell imbalance, among other conditions.

The bq30z554-R1 device has advanced charge algorithms, including JEITA support, enhanced cell charging, and adaptive charging compensating charge losses, enabling faster charging. In addition, the bq30z554-R1 device can monitor critical parameters over the life of the battery pack, tracking usage conditions.

A general purpose output is used for power interruption, employing an external push button switch.

The advanced snapshot and black box functionality show critical information for analysis of returned battery packs.

SHA-1 authentication with secure memory for authentication keys enables identification for genuine battery packs beyond doubt.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

THERMAL INFORMATION

THERMAL METRIC(1)		bq30z554-R1 TSSOP 30 PINS	UNITS
$\theta_{JA, High K}$	Junction-to-ambient thermal resistance(2)	73.1	°C/W
$\theta_{JC(top)}$	Junction-to-case(top) thermal resistance (3)	17.5	
θ_{JB}	Junction-to-board thermal resistance (4)	34.5	
ψ_{JT}	Junction-to-top characterization parameter (5)	0.3	
ψ_{JB}	Junction-to-board characterization parameter (6)	30.3	
$\theta_{JC(bottom)}$	Junction-to-case(bottom) thermal resistance (7)	n/a	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.
(2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
(3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
(4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
(5) The junction-to-top characterization parameter, ψ_{JT}, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining θ_{JA}, using a procedure described in JESD51-2a (sections 6 and 7).
(6) The junction-to-board characterization parameter, ψ_{JB}, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining θ_{JA} , using a procedure described in JESD51-2a (sections 6 and 7).
(7) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

FEATURE SET

Protections Safety Features

The bq30z554-R1 supports a wide range of battery and system protection features that can easily be configured. The Protections safety features include:

- Cell Undervoltage Protection
- Cell Undervoltage I*R Compensated Protection
- Cell Overvoltage Protection
- Overcurrent in Charge Protection 1 and 2
- Overcurrent in Discharge Protection 1 and 2
- Overload in Discharge Protection
- Short Circuit in Charge Protection
- Short Circuit in Discharge Protection 1 and 2
- Overtemperature in Charge Protection
- Overtemperature in Discharge Protection
- Overtemperature FET protection
- SBS Host Watchdog Protection
- Precharge Timeout Protection
- Fast Charge Timeout Protection
- Overcharge Protection
- Overcharging Current Protection
- Overcharging Voltage Protection

Permanent Fail Safety Features

The FUSE pin can be used to blow an in-line fuse to permanently disable the battery pack from charging or discharging. Upon a Permanent Fail event trigger, critical system information is written to non-volatile memory to simplify failure analysis. In addition, the black box stores the sequence of safety events also into non-volatile memory to simplify failure analysis. The Permanent Fail safety features include:

- Cell Undervoltage Protection
- Cell Overvoltage Protection
- Copper Deposition
- Overtemperature Cell
- Overtemperature FET
- QMAX Imbalance
- Cell Balancing
- Capacity Degradation
- Impedance
- Voltage Imbalance at Rest
- Voltage Imbalance Active
- Charge FET and Discharge FET
- Thermistor
- Chemical FUSE
- AFE Register
- AFE Communication
- 2nd-Level Protection
- PTC
- Instruction Flash
- Open Cell Tab Connection
- Data Flash

Charge Control Features

The bq30z554-R1 Charge Control features include:

- Supports JEITA temperature ranges T1, T2, T3, T4, T5, T6. Reports charging voltage and charging current, according to the active temperature range.
- Handles more complex charging profiles. Allows for splitting the standard temperature range into two sub-ranges, and allows for varying the charging current according to the cell voltage.
- Reports the appropriate charging current needed for constant current charging and the appropriate charging voltage needed for constant voltage charging to a smart charger using SMBus broadcasts.
- Determines the chemical state of charge of each battery cell using Impedance Track and can reduce the charge difference of the battery cells in a fully charged state of the battery pack, gradually using the cell balancing algorithm during rest and charging. This prevents fully charged cells from overcharging and causing excessive degradation, and also increases the usable pack energy by preventing premature charge termination.
- Supports precharging/zero-volt charging
- Supports charge inhibit and charge suspend if the battery pack temperature is out of temperature range.
- Reports charging fault and also indicates charge status via charge and discharge alarms.

Gas Gauging

The bq30z554-R1 uses the Impedance Track technology to measure and calculate the available charge in battery cells. The achievable accuracy is better than 1% error over the lifetime of the battery and there is no full charge or discharge learning cycle required. See the *Theory and Implementation of Impedance Track Battery Fuel-Gauging Algorithm* application report (SLUA364B) for further details.

Lifetime Data Logging Features

The bq30z554-R1 offers extended lifetime data logging where important measurements are stored for warranty and analysis purposes. The data monitored includes *lifetime*:

- Maximum cell voltage cell0, cell1, cell2, cell3
- Minimum cell voltage cell0, cell1, cell2, cell3
- Maximum cell voltage delta
- Maximum charge and discharge current
- Maximum average discharge current
- Maximum average discharge power
- Maximum cell temperature
- Minimum cell temperature
- Maximum cell temperature delta
- Maximum device temperature
- Minimum device temperature
- Maximum FET temperature
- Total accumulated safety events and last safety event in term of charging cycle
- Total accumulated charging events and charging events
- Total accumulated gauging events and gauging events
- Total accumulated cell balancing time cell0, cell1, cell2, cell3
- Total device firmware runtime
- Accumulated runtime in JEITA undertemperature range
- Accumulated runtime in JEITA low temperature range
- Accumulated runtime in JEITA standard temperature range
- Accumulated runtime in JEITA recommended temperature range
- Accumulated runtime in JEITA high temperature range
- Accumulated runtime in JEITA overtemperature range

Authentication

- The bq30z554-R1 supports authentication by the host using SHA-1.
- SHA-1 authentication by the gas gauge is required for unsealing and full access.

Power Modes

The bq30z554-R1 supports five power modes to reduce power consumption:

- In NORMAL mode, the bq30z554-R1 performs measurements, calculations, protection decisions, and data updates in 0.25-s intervals. Between these intervals, the bq30z554-R1 is in a reduced power stage. In addition, the device will provide information for peak TURBO mode power operation.
- The bq30z554-R1 supports a TURBO mode operation by providing information to the host MCU about the battery pack's ability to deliver peak power. The method of operation is based on the host MCU reading register 0x59 (TURBO_POWER) to determine if the selected power level for TURBO mode operation of the MCU is below the max power reported by the gas gauge. Additionally, the device reports current information during the power pulse by reading register 0x5E (TURBO_CURRENT). The information reported by these two registers allows the MCU to determine if the selected TURBO mode operation is safe and will not cause any system reset due to transient power pulses.
- In SLEEP mode, the bq30z554-R1 performs measurements, calculations, protection decisions, and data updates in adjustable time intervals. Between these intervals, the bq30z554-R1 is in a reduced power stage. The bq30z554-R1 has a wake function that enables exit from SLEEP mode when current flow or failure is detected.
- In SHUTDOWN mode, the bq30z554-R1 is completely disabled.
- In SHIP mode, the bq30z554-R1 enters a low-power mode with no voltage, current, and temperature measurements, the FETs are turned off, and the MCU is in a halt state. The device wakes up upon SMBus communication detection.

NOTE

For a detailed description of the SBS Commands and Data Flash (DF) Registers, refer to the *bq30z554-R1 Technical Reference Manual* (SLUUA79).

Configuration

System Present Operation

The bq30z554-R1 checks the $\overline{\text{PRES}}$ pin periodically (1 s). If $\overline{\text{PRES}}$ input is pulled to ground by the external system, the bq30z554-R1 detects this as system present.

Battery Power Interrupt Operation

The bq30z554-R1 can interrupt the battery power by using an external push-button switch and detecting a low-level threshold signal on the GPIO terminal (pin should be configured with an internal pull-up). Once the push button is pressed, there is a delay of 1 s (default) for debounce to detect the low-level threshold. There is also a data flash command for the battery power interrupt timeout. The default value is 30 minutes. If the push-button switch is selected before this timeout, the battery power is restored based on this action.

Timeout Configuration

The timeout feature allows the battery power to be restored once the timer expires. Alternatively, if the value is set to 0, this feature is disabled.

Class	Subclass ID	Subclass	Offset	Name	Type	Min	Max	Default	Unit
Power	248	Power Off	0	Timeout	U2	0	65535	30	min

BATTERY PARAMETER MEASUREMENTS

Charge and Discharge Counting

The bq30z554-R1 uses an integrating delta-sigma analog-to-digital converter (ADC) for current measurement, and a second delta-sigma ADC for individual cell and battery voltage and temperature measurements.

The integrating delta-sigma ADC measures the charge/discharge flow of the battery by measuring the voltage drop across a small-value sense resistor between the SR1 and SR2 pins. The integrating ADC measures bipolar signals from –0.25 V to 0.25 V. The bq30z554-R1 detects charge activity when $V_{SR} = V_{(SRP)} – V_{(SRN)}$ is positive, and discharge activity when $V_{SR} = V_{(SRP)} – V_{(SRN)}$ is negative. The bq30z554-R1 continuously integrates the signal over time, using an internal counter. The fundamental rate of the counter is 0.65 nVh.

Voltage

The bq30z554-R1 updates the individual series cell voltages at 0.25-s intervals. The internal ADC of the bq30z554-R1 measures the voltage, and scales and calibrates it appropriately. This data is also used to calculate the impedance of the cell for the Impedance Track gas gauging.

Current

The bq30z554-R1 uses the SRP and SRN inputs to measure and calculate the battery charge and discharge current using a 5-mΩ to 20-mΩ typ. sense resistor.

Auto Calibration

The bq30z554-R1 provides an auto-calibration feature to cancel the voltage offset error across SRN and SRP for maximum charge measurement accuracy. The bq30z554-R1 performs auto-calibration when the SMBus lines stay low continuously for a minimum of 5 s.

Temperature

The bq30z554-R1 has an internal temperature sensor and inputs for four external temperature sensors. All five temperature sensor options are enabled individually and configured for cell or FET temperature. Two configurable thermistor models are provided to allow the monitoring of cell temperature in addition to FET temperature, which may be of a higher temperature type.

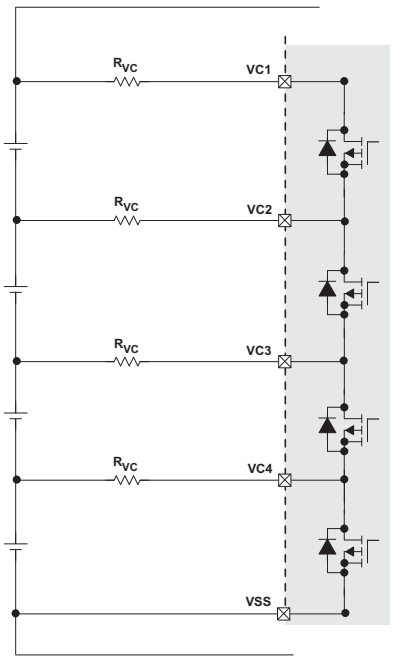
CELL BALANCING

The device supports cell balancing by bypassing the current of each cell during charging or at rest. If the device internal bypass is used, up to 10 mA can be bypassed and multiple cells can be bypassed at the same time. Higher cell balance current can be achieved by using an external cell balancing circuit. In EXTERNAL CELL BALANCING mode, only one cell at a time can be balanced.

The cell balancing algorithm determines the amount of charge needed to be bypassed to balance the capacity of all cells.

Internal Cell Balancing

When internal cell balancing is configured, the cell balance current is defined by the external resistor R_{VC} at the VCx input.



External Cell Balancing

When internal cell balancing is configured, the cell balance current is defined by R_B. Only one cell at a time can be balanced.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have ***not*** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
