Nano Energy™

Ultra Low Iq Buck Converter For Low Power Applications

BD70522GUL

General Description

The BD70522GUL is a Buck Converter featuring 180nA quiescent current and supports output current up to 500mA. The Constant ON-Time (COT) control with ULP (Ultra Low Power) mode provides superior transient response and extends battery life by providing excellent light load efficiency below 10µA load range. The output voltage can be selected from 9 pre-set voltages by VSEL pins. When the input voltage gets close to the output voltage, the IC enters 100%ON mode where the switching operation stops.

Key Specifications

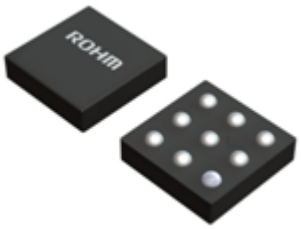
- Input Voltage Range: 2.5V to 5.5V
- Output Voltage Range: 1.2V to 3.3V
- Maximum Output Current: 500mA
- Operating Quiescent Current: 180nA (Typ)
- Standby Current: 50nA (Typ)
- Operating Temperature Range: -40°C to +85°C

Package **W(Typ) x D(Typ) x H(Max)**

VCSP50L1C 1.76mm x 1.56mm x 0.57mm

Features

- Nano Energy™
- 180nA (Typ) Quiescent Current
- Up to 90% Efficiency at 10µA Output Current
- Up to 500mA Output Current
- 9 Selectable Output Voltages (1.2V, 1.5V, 1.8V, 2.0V, 2.5V, 2.8V, 3.0V, 3.2V, 3.3V)
- Power Good Output
- 100%ON Mode for Low Input Voltage
- Discharge Function on VOUT



Applications

- Smoke Detector
- Thermostat
- Portable Devices
- Wearable Devices
- Low-Iq Applications without Standby Switcher
- Energy Harvesting

Pin Configuration

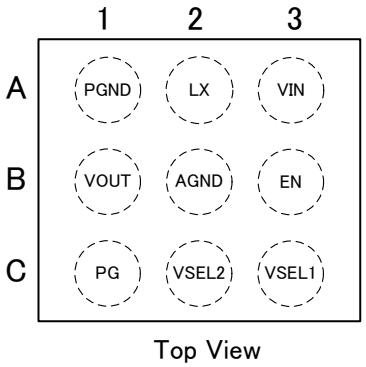

Figure 2. Pin Configuration

Pin Descriptions

Pin No.	Pin Name	Description
A1	PGND	Power Ground Pin
A2	LX	Switching Pin. Connect an inductor to this pin.
A3	VIN	Power Supply Input Pin. Connect an input capacitor close to this pin.
B1	VOUT	Feedback Pin for internal feedback divider network and regulation loop. This pin is also used for VOUT discharge while EN pin is set to low.
B2	AGND	Analog Ground Pin
B3	EN	Enable Pin. This pin must be terminated. High : Enable Low : Shutdown Do not pull up EN terminal higher than VIN voltage.
C1	PG	Power Good Open Drain Output Pin. PG remains low while the VOUT pin voltage is lower than the threshold voltage. If not used, this pin can be left open. Do not pull up PG terminal to a voltage which is higher than VIN voltage.
C2	VSEL2	Output Voltage Selection Pins. These pins have three states : High = VIN (Connect these pins to VIN directly without pull up resistors) Low = GND (Connect these pins to GND directly without pull down resistors) OPEN = No Connection (PCB:C<50pF, R>1Mohm) The setting of these pins cannot be changed while the IC is operating.
C3	VSEL1

Absolute Maximum Ratings (Ta=25°C)

Parameter	Symbol	Rating	Unit
Supply Voltage	V_{IN}	-0.3 to +6	V
LX Voltage	V_{LX}	-0.3 to V_{IN}+0.3V	V
EN Voltage	V_{EN}	-0.3 to V_{IN}+0.3V	V
PG Voltage	V_{PG}	-0.3 to V_{IN}+0.3V	V
VSEL1, 2 Voltage	V_{SEL}	-0.3 to V_{IN}+0.3V	V
PG Sink Current	I_{PG}	10	mA
Power Dissipation	Pd	0.592 *(Note 1)*	W
Maximum Junction Temperature	Tjmax	150	°C
Storage Temperature Range	Tstg	- 55 to + 150	°C

Caution 1: *Operating the IC over the absolute maximum ratings may damage the IC. The damage can either be a short circuit between pins or an open circuit between pins and the internal circuitry. Therefore, it is important to consider circuit protection measures, such as adding a fuse, in case the IC is operated over the absolute maximum ratings.*

Caution 2: *Should by any chance the maximum junction temperature rating be exceeded the rise in temperature of the chip may result in deterioration of the properties of the chip. In case of exceeding this absolute maximum rating, design a PCB boards with power dissipation taken into consideration by increasing board size and copper area so as not to exceed the maximum junction temperature rating.*

(Note 1) The derating is 4.74 mW/°C while the device is operating above Ta≧25°C (Mounted on 4-layer 50.0mm x 58.0mm x 1.6mm FR-4 board)

Thermal Resistance

Parameter	Symbol	Thermal Resistance (Typ)	Unit
VCSP50L1C			
Junction to Ambient	θ_{JA}	168.8	°C/W

Layer Number of Measurement Board	Material	Board Size
4 Layers	FR-4	50.0mm x 58.0mm x 1.6mmt

Recommended Operating Conditions

Parameter	Symbol	Min	Typ	Max	Unit
Supply Voltage *(Note 2)*	V_{IN}	2.5	3.6	5.5	V
Output Current	I_{OUT}	-	-	500	mA
Inductance *(Note 3)*	L	-	2.2	-	µH
Output Capacitance *(Note 4)*	C_{OUT}	10	22	100	µF
Operating Temperature	Topr	-40	+25	+85	°C

(Note 2) Initial startup voltage is over 2.6V (Max)

(Note 3) The effective inductance should be kept in the specified range from 1.5µH to 3.5µH, including the variety of tolerance, temperature, current derating.

(Note 4) The effective capacitance should be kept this specified range including variety of tolerance, temperature, bias voltage derating.

Electrical Characteristics

(Unless otherwise specified V_{IN}=3.6V Ta=25°C)

Parameter	Symbol	Min	Typ	Max	Unit	Conditions
Circuit Current						
Shutdown Current	I_{ST}	-	50	1000	nA	
Operating Quiescent Current	I_Q	-	180	1000	nA	No switching, V_{EN}= V_{IN} V_{SEL}=V_{IN} Include VSEL, EN pin current
Under Voltage Lockout						
UVLO Detection Threshold	V_{UVLO}	2.30	2.40	2.50	V	V_{IN} falling
UVLO Release Threshold	$V_{UVLORLS}$	2.40	2.50	2.60	V	V_{IN} rising

Detailed Descriptions

1. Constant ON-Time (COT) Control

The COT control topology supports CCM (Continuous Current Mode) for medium and high load conditions and DCM (Discontinuous Current Mode) for light load conditions.
The ON-Time is set in proportion to the output voltage (V_{OUT}), and in inverse proportion to power supply voltage (V_{IN}). Therefore, when in CCM, even if V_{IN} or V_{OUT} settings changes, the IC always operates in a constant frequency 1MHz (Typ) approximately.
If the load current decreases, the IC enters DCM seamlessly to maintain high efficiency down to very light loads, and the switching frequency varies approximately linearly with the load current.

2. 100%ON Mode

When V_{IN} gets close to V_{OUT}, the IC stops switching and starts 100% duty cycle operation. It connects the output to the input via the inductor and the internal high side MOSFET switch, when V_{IN} falls below the 100%ON Mode Enter Threshold (V_{100THM}). And when V_{IN} increases and exceeds the 100%ON Mode Release Threshold (V_{100THP}), the IC starts to switch again.

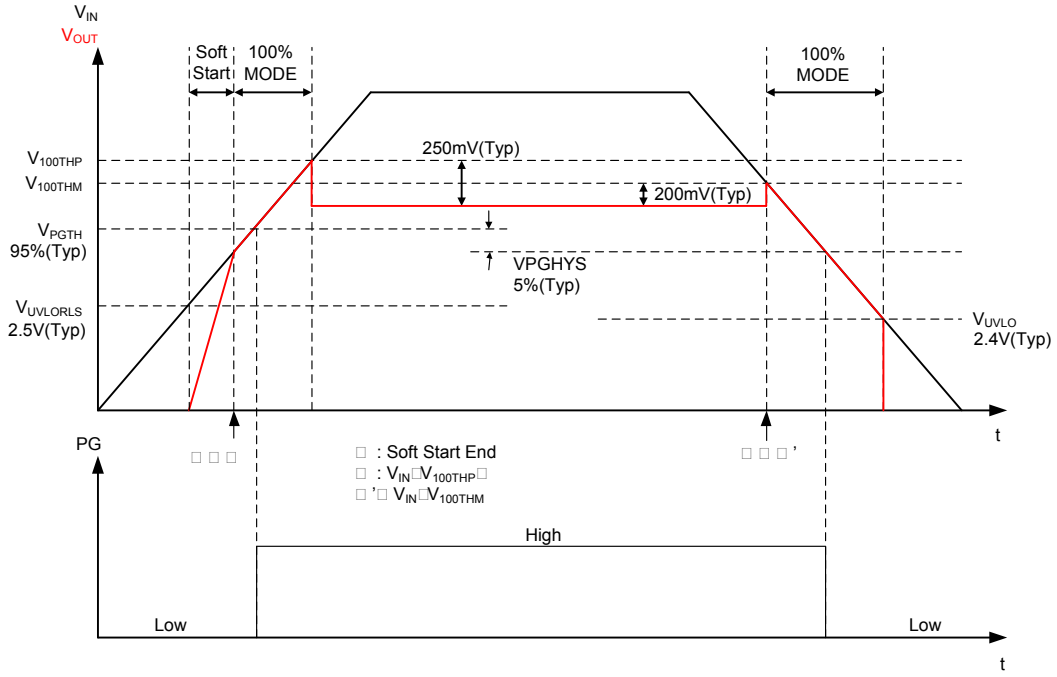

Figure 4. 100% ON Mode Transition

3. Ultra Low Power (ULP) Mode

2 comparators are used in this IC for monitoring V_{OUT}.
One is main comparator (Main Comp) and the other is ULP comparator (ULP Comp).
The transition from normal mode to ULP mode is judged pulse by pulse. While the Main Comp or the ULP Comp detects the decrease in V_{OUT}, the LX node switches for one pulse, then becomes high impedance.
If the high impedance state lasts over 8μs, the IC transits from normal mode to ULP mode.
In ULP mode, the Main Comp and the Power Good comparator (PG Comp) are disabled to reduce the current consumption. And when the ULP Comp detects the decrease in V_{OUT}, the Main Comp and the PG Comp are enabled, and the IC transits from ULP mode to normal mode.

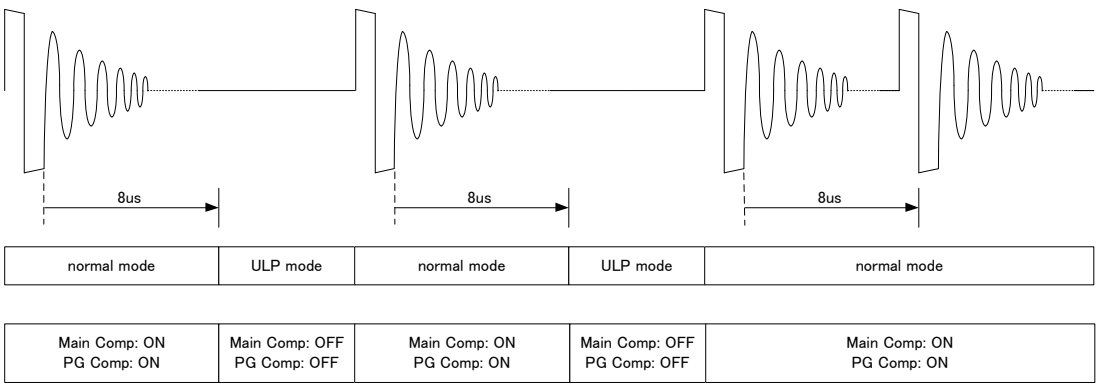

Figure 5. Transition between Normal Mode and ULP Mode

© 2017 ROHM Co., Ltd. All rights reserved.

4. On-Time Extension

The On-Time is extended automatically to get the best transient response in the case of high duty cycle operation.
If the Main Comp Output does not return to high level within Constant On-Time, the On-Time is extended until the Main Comp Output returns to high, and the maximum On-Time is limited to 16µs.

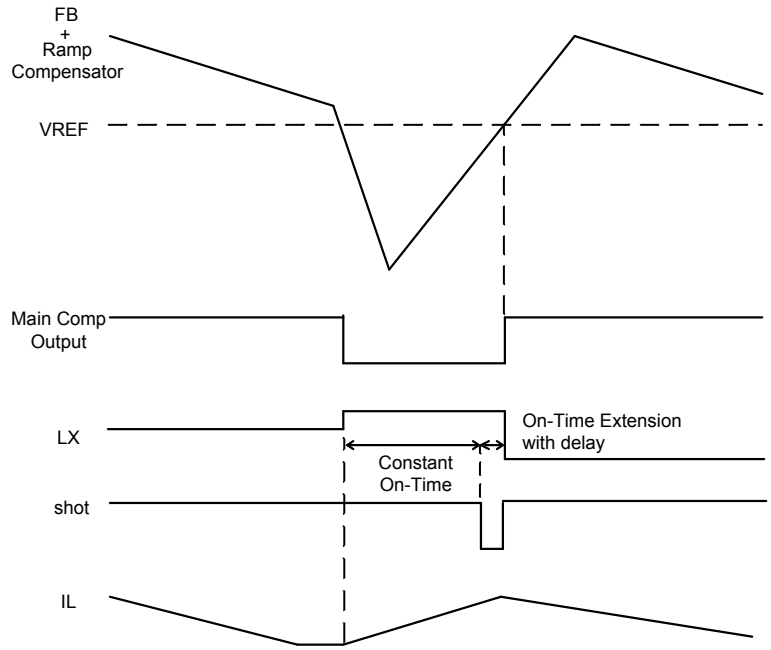

Figure 6. On-Time Extension

5. Discharge for VOUT

VOUT pin has a MOSFET for discharge which connects VOUT pin to GND when the IC is in standby state.
(EN=Low or UVLO state or TSD state)

6. Power Good (PG) Output

PG pin is an open-drain output.
The PG Comp is active when EN pin is set to high and V_{IN} is above the threshold $V_{UVLORLS}$.
PG pin remains low when the V_{OUT} is lower than the PG detection threshold (V_{PGTH}) or during the soft-start time.
PG pin goes to high impedance when V_{OUT} exceeds V_{PGTH}.
And it is pulled to low level once V_{OUT} falls below the PG release threshold (V_{PGTH}-V_{PGHYS}).

7. Under Voltage Lock Out (UVLO)

UVLO function prevents the malfunction of the internal circuit when V_{IN} is too low.
If V_{IN} falls lower than 2.4V (Typ), the IC turns off.
In order to prevent from the misdetection of UVLO, it is necessary to set V_{IN} higher than 2.5V (Typ).

8. Over Current Limit (OCL)

BD70522GUL employs a bottom inductor current limit function which is achieved by using the low side MOSFET. Turning on the high side MOSFET is prohibited while the inductor current is higher than the low side OCL (I_{LIMITL}). This function keeps the inductor peak current lower than the sum of I_{LIMITL} and the inductor ripple current.
However, the low side OCL function does not work if the VOUT pin is directly shorted to GND. Thus, a high side OCL is implemented for such case. The high side MOSFET turns off when the inductor current exceeds the high side OCL ($I_{LIMITH1}$). Furthermore, the peak current is limited to $I_{LIMITH1}$×0.67 under the On-Time extension state.
The inductor current is also limited to $I_{LIMITH2}$ under 100%ON mode, and the high side MOSFET is used to sense the current in this case.

9. Thermal Shutdown (TSD)

BD70522GUL stops the switching operation when the device temperature exceeds the TSD detection threshold 130°C (Typ) for protecting the IC from overheat. After the device temperature falls below the TSD release threshold 115°C (Typ), the IC starts the soft-start operation and recovers to the normal operation.

Timing Chart

After BD70522GUL is enabled, the internal reference voltage is booted up.

When the startup delay time t_{SDELAY} has expired, the switching is started by the soft-start operation, and the output voltage is ramped up to the set voltage (V_{OUTSET}) which is determined by the states of VSEL1 and VSEL2 during the startup delay in normal operation.

Operational Notes

1. **Reverse Connection of Power Supply**
   Connecting the power supply in reverse polarity can damage the IC. Take precautions against reverse polarity when connecting the power supply, such as mounting an external diode between the power supply and the IC's power supply pins.

2. **Power Supply Lines**
   Design the PCB layout pattern to provide low impedance supply lines. Furthermore, connect a capacitor to ground at all power supply pins. Consider the effect of temperature and aging on the capacitance value when using electrolytic capacitors.

3. **Ground Voltage**
   Ensure that no pins are at a voltage below that of the ground pin at any time, even during transient condition.

4. **Ground Wiring Pattern**
   When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. Also ensure that the ground traces of external components do not cause variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance.

5. **Recommended Operating Conditions**
   The function and operation of the IC are guaranteed within the range specified by the recommended operating conditions. The characteristic values are guaranteed only under the conditions of each item specified by the electrical characteristics.

6. **Inrush Current**
   When power is first supplied to the IC, it is possible that the internal logic may be unstable and inrush current may flow instantaneously due to the internal powering sequence and delays, especially if the IC has more than one power supply. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of connections.

7. **Operation Under Strong Electromagnetic Field**
   Operating the IC in the presence of a strong electromagnetic field may cause the IC to malfunction.

8. **Testing on Application Boards**
   When testing the IC on an application board, connecting a capacitor directly to a low-impedance output pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC's power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

9. **Inter-pin Short and Mounting Errors**
   Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.

10. **Unused Input Pins**
    Input pins of an IC are often connected to the gate of a MOS transistor. The gate has extremely high impedance and extremely low capacitance. If left unconnected, the electric field from the outside can easily charge it. The small charge acquired in this way is enough to produce a significant effect on the conduction through the transistor and cause unexpected operation of the IC. So unless otherwise specified, unused input pins should be connected to the power supply or ground line.

© 2017 ROHM Co., Ltd. All rights reserved.

11. Regarding the Input Pin of the IC

This monolithic IC contains P+ isolation and P substrate layers between adjacent elements in order to keep them isolated. P-N junctions are formed at the intersection of the P layers with the N layers of other elements, creating a parasitic diode or transistor. For example (refer to figure below):

When GND > Pin A and GND > Pin B, the P-N junction operates as a parasitic diode.
When GND > Pin B, the P-N junction operates as a parasitic transistor.

Parasitic diodes inevitably occur in the structure of the IC. The operation of parasitic diodes can result in mutual interference among circuits, operational faults, or physical damage. Therefore, conditions that cause these diodes to operate, such as applying a voltage lower than the GND voltage to an input pin (and thus to the P substrate) should be avoided.

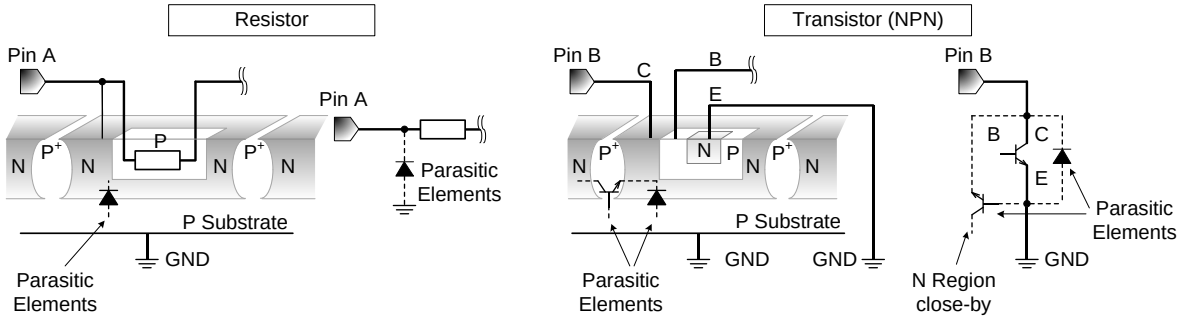

Figure xx. Example of monolithic IC structure

12. Ceramic Capacitor

When using a ceramic capacitor, determine a capacitance value considering the change of capacitance with temperature and the decrease in nominal capacitance due to DC bias and others.

13. Area of Safe Operation (ASO)

Operate the IC such that the output voltage, output current, and the maximum junction temperature rating are all within the Area of Safe Operation (ASO).

14. Thermal Shutdown Circuit(TSD)

This IC has a built-in thermal shutdown circuit that prevents heat damage to the IC. Normal operation should always be within the IC's maximum junction temperature rating. If however the rating is exceeded for a continued period, the junction temperature (Tj) will rise which will activate the TSD circuit that will turn OFF power output pins. When the Tj falls below the TSD threshold, the circuits are automatically restored to normal operation.
Note that the TSD circuit operates in a situation that exceeds the absolute maximum ratings and therefore, under no circumstances, should the TSD circuit be used in a set design or for any purpose other than protecting the IC from heat damage.

15. Over Current Protection Circuit (OCP)

This IC incorporates an integrated overcurrent protection circuit that is activated when the load is shorted. This protection circuit is effective in preventing damage due to sudden and unexpected incidents. However, the IC should not be used in applications characterized by continuous operation or transitioning of the protection circuit.

16. Disturbance Light

In a device where a portion of silicon is exposed to light such as in a WL-CSP and chip products, IC characteristics may be affected due to photoelectric effect. For this reason, it is recommended to come up with countermeasures that will prevent the chip from being exposed to light.

Notice

Precaution on using ROHM Products

1. Our Products are designed and manufactured for application in ordinary electronic equipment (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment (Note 1), transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

JAPAN	USA	EU	CHINA
CLASSⅢ	CLASSⅢ	CLASSⅡb	CLASSⅢ
CLASSⅣ		CLASSⅢ	

2. ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
   [a] Installation of protection circuits or other protective devices to improve system safety
   [b] Installation of redundant circuits to reduce the impact of single or multiple circuit failure

3. Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc, prior to use, must be necessary:
   [a] Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
   [b] Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
   [c] Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl_2, H_2S, NH_3, SO_2, and NO_2
   [d] Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
   [e] Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
   [f] Sealing or coating our Products with resin or other coating materials
   [g] Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
   [h] Use of the Products in places subject to dew condensation

4. The Products are not subject to radiation-proof design.

5. Please verify and confirm characteristics of the final or mounted products in using the Products.

6. In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse. is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.

7. De-rate Power Dissipation depending on ambient temperature. When used in sealed area, confirm that it is the use in the range that does not exceed the maximum junction temperature.

8. Confirm that operation temperature is within the specified range described in the product specification.

9. ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

Precaution for Mounting / Circuit board design

1. When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.

2. In principle, the reflow soldering method must be used on a surface-mount products, the flow soldering method must be used on a through hole mount products. If the flow soldering method is preferred on a surface-mount products, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

Precautions Regarding Application Examples and External Circuits

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.

2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

Precaution for Electrostatic

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of Ionizer, friction prevention and temperature / humidity control).

Precaution for Storage / Transportation

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
   [a] the Products are exposed to sea winds or corrosive gases, including Cl2, H2S, NH3, SO2, and NO2
   [b] the temperature or humidity exceeds those recommended by ROHM
   [c] the Products are exposed to direct sunshine or condensation
   [d] the Products are exposed to high Electrostatic

2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.

3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.

4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

Precaution for Product Label

A two-dimensional barcode printed on ROHM Products label is for ROHM's internal use only.

Precaution for Disposition

When disposing Products please dispose them properly using an authorized industry waste company.

Precaution for Foreign Exchange and Foreign Trade act

Since concerned goods might be fallen under listed items of export control prescribed by Foreign exchange and Foreign trade act, please consult with ROHM in case of export.

Precaution Regarding Intellectual Property Rights

1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data.

2. ROHM shall not have any obligations where the claims, actions or demands arising from the combination of the Products with other articles such as components, circuits, systems or external equipment (including software).

3. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the Products or the information contained in this document. Provided, however, that ROHM will not assert its intellectual property rights or other rights against you or your customers to the extent necessary to manufacture or sell products containing the Products, subject to the terms and conditions herein.

Other Precaution

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.

2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.

3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.

4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.

General Precaution

1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM's Products against warning, caution or note contained in this document.

2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the latest information with a ROHM sales representative.

3. The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits,General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
