

USB 2.0 High-Speed, Fault-Tolerant 3:1, 4:1 Multiplexers

General Description

The MAX4899E/MAX4899AE analog multiplexers combine the low on-capacitance (C_{ON}) and low on-resistance (R_{ON}) necessary for high-performance switching applications. These devices are designed for USB 2.0 high-speed applications at 480Mbps. The MAX4899E/MAX4899AE also handle all the requirements for USB low- and full-speed signaling.

The MAX4899E is a dual 3:1 multiplexer whereas the MAX4899AE is a dual 4:1 multiplexer. The MAX4899E/MAX4899AE feature two digital inputs, C_0 and C_1 , to control the analog signal path. Typical applications include switching a USB connector between USB and other operations such as serial communications, audio, and video.

An enable input (\overline{EN}) is provided to disable all channels and place the device into a high-impedance (off) state, as well as reducing power consumption.

The MAX4899E/MAX4899AE operate from a 2.7V to 3.6V power-supply voltage and are protected against +5.5V shorts to COM_{A-} and COM_{A+} . In addition, COM_{A+} and COM_{A-} are normally connected to outside circuitry and feature $\pm 15kV$ ESD protection. The MAX4899E/MAX4899AE are available in a 3mm x 3mm, 16-pin TQFN package and operate over the $-40^{\circ}C$ to $+85^{\circ}C$ temperature range.

Applications

- Cell Phones
- Digital Still Cameras
- PDA's
- Digital Video Cameras
- MPEG-4 Players
- Portable GPS
- Combination Products
- KVM

Features

- ◆ Single 2.7V to 3.6V Power-Supply Voltage
- ◆ Low 4Ω (typ) On-Resistance (R_{ON})
- ◆ -3dB Bandwidth: 425MHz
- ◆ Fault Tolerant to Meet Full USB 2.0 Specification
- ◆ COM_{-} Protected to $\pm 15kV$ ESD Protection per Human Body Model (MIL-STD-883; Method 3015)
- ◆ Low Operating Current (200 μA), Ultra-Low Quiescent Current (3.0 μA max) in Standby Mode
- ◆ Low Threshold Eliminates the Need for Translators in 1.8V Low Voltage Systems
- ◆ Tiny 16-Pin, 3mm x 3mm, Lead-Free TQFN Package

Eye Diagram

Pin Configurations appear at end of data sheet.

USB 2.0 High-Speed, Fault-Tolerant 3:1, 4:1 Multiplexers

ABSOLUTE MAXIMUM RATINGS

(All Voltages Referenced to GND.)

V+	-0.3V to +4V
\overline{QP} , \overline{EN} , C ₀ , C ₁ , (Note 1)	-0.3V to +4V
COM _{A+} , COM _{A-} , USB0+, USB0-, USB1+, USB1-, USB2+, USB2-, USB3+, USB3-	-0.3V to +5.5V
Continuous Current (COM _{A-} to USB ₋)	±120mA
Peak Current (COM _{A-} to USB ₋) (pulsed at 1ms, 10% duty cycle)	±240mA

Continuous Power Dissipation (T_A = +70°C)

16-Pin TQFN (derate 20.8mW/°C above +70°C)	1667mW
Operating Temperature Range	-40°C to +85°C
Storage Temperature Range	-65°C to +150°C
Junction Temperature	+150°C
Lead Temperature (soldering, 10s)	+300°C

Note 1: Signals exceeding GND are clamped by internal diodes. Limit forward-diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V+ = +2.7V to +3.6V, T_A = -40°C to +85°C, \overline{QP} = low, \overline{EN} = low, unless otherwise noted. Typical values are at V+ = +3.3V and T_A = +25°C.) (Note 2)

Detailed Description

The MAX4899E/MAX4899AE analog multiplexers combine the low on-capacitance (C_{ON}) and low on-resistance (R_{ON}) necessary for high-performance switching applications. These devices are designed for USB 2.0 high-speed applications at 480Mbps. The MAX4899E/MAX4899AE also handle all the requirements for USB low- and full-speed signaling. In the case of USB low/full speed, these devices can function normally even if the supply voltage is 2.7V, even though the USB signal may be higher than the supply voltage.

The MAX4899E is a dual 3:1 multiplexer, whereas the MAX4899AE is a dual 4:1 multiplexer. The MAX4899E/MAX4899AE feature two digital inputs, C_0 and C_1 , to control the analog signal path. Typical applications include switching a USB connector between USB and other operations such as serial communications, audio, and video.

An enable input (\overline{EN}) is provided to disable all channels and place the device into a high-impedance (off) state, as well as shutting off the charge pump for minimum power consumption. The MAX4899E/MAX4899AE feature an additional charge-pump enable input (\overline{QP}) to disable the charge pump. The switches remain active at a lower analog signal range and higher R_{ON} .

The MAX4899E/MAX4899AE operate from a 2.7V to 3.6V power-supply voltage and are current-limit protected against +5.5V shorts to COM_{A-} and COM_{A+} .

Digital Control Inputs (C_0 , C_1)

The MAX4899E/MAX4899AE provide two digital control inputs (C_0 , C_1) to select the analog signal path between the COM_{A-} and USB_{-} channels. The truth tables for the MAX4899E/MAX4899AE are shown in the *Functional Diagrams*. Since the MAX4899E only has three USB_{-} channels, the code $C_1:C_0 = 1:1$ can be used to place all channels into a high-impedance state. This is particularly useful for eliminating the extra control line to the \overline{EN} input that is normally used for disabling all channels. Driving C_0 and C_1 rail-to-rail minimizes power consumption.

Enable Input (\overline{EN})

The MAX4899E/MAX4899AE feature an enable input (\overline{EN}) that when driven high places all channels into a high-impedance state, as an all-off feature. The internal charge pump is also disabled when \overline{EN} is high, thus minimizing the quiescent supply current. For normal operation, drive \overline{EN} low.

Charge-Pump Enable Input (\overline{QP})

The charge-pump input (\overline{QP}) disables and enables the internal charge pump. Drive \overline{QP} high to disable the charge pump and reduce the quiescent supply current.

With the charge pump disabled, the MAX4899E/MAX4899AE still function normally; however, the analog signal range is reduced and the switch on-resistance (R_{ON}) is increased. The analog signal range with the charge pump disabled is 0V to 1.5V. For normal operation, drive \overline{QP} low.

Analog Signal Levels

Signals applied to COM_{A+} are routed to the USB_{+} terminals, and signals applied to COM_{A-} are routed to the USB_{-} terminals. These multiplexers are bidirectional, allowing COM_{A-} and USB_{-} to be configured as either inputs or outputs. The D+ and D- notation in the *Pin Description* table is arbitrary and can be interchanged. For example, USB D+ signals can be applied to COM_{A-} and are routed to the USB_{-} terminals. Additionally, these multiplexers can be used for non-USB signals. COM_{A+} and COM_{A-} are normally connected to outside circuitry and are ± 15 kV ESD protected.

The MAX4899E is a dual 3:1 multiplexer, allowing COM_{A+} to be routed to one of three USB_{+} channels, and COM_{A-} to be routed to one of three USB_{-} channels. The MAX4899AE is a dual 4:1 multiplexer, allowing COM_{A+} to be routed to one of four USB_{+} channels, and COM_{A-} to be routed to one of four USB_{-} channels.

Overvoltage Fault Protection

The MAX4899E/MAX4899AE feature +5.5V fault protection to COM_{A+} and COM_{A-} . When a fault occurs between 4.5V to 5.5V, the switch automatically goes into a current-limiting mode that limits current to less than 2mA. Fault protection prevents these switches and downstream devices from being damaged due to shorts to the USB bus voltage rail.

Applications Information

USB Switching

The MAX4899E/MAX4899AE analog multiplexers are fully compliant with the USB 2.0 specification. The low on-resistance and low on-capacitance of these multiplexers make them ideal for high-performance switching applications. The MAX4899E/MAX4899AE are ideal for routing USB data lines and for applications that require switching between different data types (see Figure 8).

Board Layout

High-speed switches require proper layout and design procedures for optimum performance. Keep design-controlled impedance PC board traces as short as possible. Ensure that bypass capacitors are placed as close to the device as possible and use large ground planes where possible.

USB 2.0 High-Speed, Fault-Tolerant 3:1, 4:1 Multiplexers

Figure 8. MAX4899AE Multiplexing Four Data Types

ESD Protection

As with all Maxim devices, ESD-protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. The COM_{A+} and COM_{A-} lines have extra protection against static electricity. Maxim's engineers have developed state-of-the-art structures to protect these pins against ESD of ±15kV without damage. The ESD structures withstand high ESD in all states: normal operation, tri-state output mode, and powered down. After an ESD event, Maxim's E-versions keep working without latch-up, whereas competing products can latch and must be powered down to remove latch-up.

Human Body Model

The MAX4899E/MAX4899AE COM_{A+} and COM_{A-} pins are characterized for ±15kV ESD protection using the Human Body Model (MIL-STD-883, Method 3015). Figure 9a shows the Human Body Model and Figure 9b shows the current waveform it generates when discharged into a low impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the device through a 1.5kΩ resistor.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
