

1-Cell to 3-Cell, High-Power (1.5A), Low-Noise, Step-Up DC-DC Converter

General Description

The MAX1703 is a high-efficiency, low-noise, step-up DC-DC converter intended for use in battery-powered wireless applications. It uses a synchronous-rectified pulse-width-modulation (PWM) boost topology to generate a 2.5V to 5.5V output from battery inputs, such as one to three NiCd/NiMH cells or one Li-Ion cell. The device includes a 2A, 75mΩ, N-channel MOSFET switch and a 140mΩ, P-channel synchronous rectifier.

With its internal synchronous rectifier, the MAX1703 delivers up to 5% better efficiency than similar nonsynchronous converters. It also features a pulse-frequency-modulation (PFM) low-power mode to improve efficiency at light loads, and a 1μA shutdown mode.

The MAX1703 comes in a 16-pin narrow SO package and includes an uncommitted comparator that generates a power-good or low-battery-warning output. It also contains a linear gain block that can be used to build a linear regulator.

For lower-power outputs and a smaller package, refer to the MAX1700/MAX1701. For dual outputs (step-up plus linear regulator), refer to the MAX1705/MAX1706. For an on-board analog-to-digital converter, refer to the MAX848/MAX849.

The MAX1703 evaluation kit is available to speed designs.

Features

- ◆ Up to 95% Efficiency
- ◆ Up to 1.5A Output
- ◆ Fixed 5V or Adjustable Step-Up Output (2.5V to 5.5V)
- ◆ 0.7V to 5.5V Input Range
- ◆ Low-Power Mode (300μW)
- ◆ Low-Noise, Constant-Frequency Mode (300kHz)
- ◆ Synchronizable Switching Frequency (200kHz to 400kHz)
- ◆ 1μA Logic-Controlled Shutdown
- ◆ Power-Good Comparator
- ◆ Uncommitted Gain Block

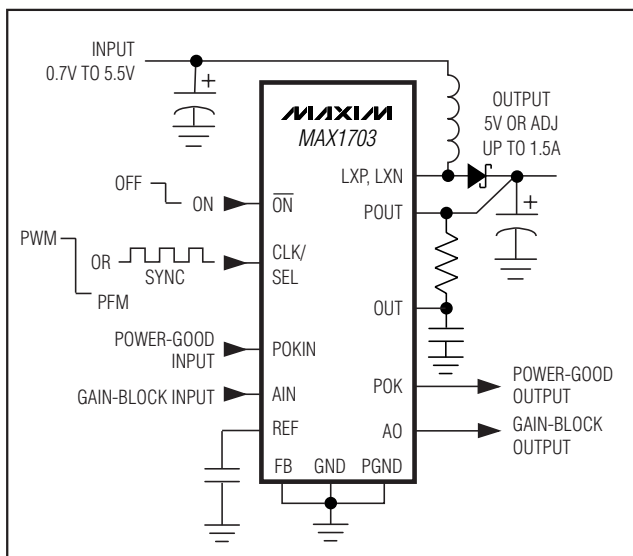

Ordering Information

PART	TEMP. RANGE	PIN-PACKAGE
MAX1703ESE	-40°C to +85°C	16 Narrow SO

Applications

Digital Cordless Phones	Personal Communicators
PCS Phones	Palmtop Computers
Wireless Handsets	Hand-Held Instruments
Two-Way Pagers	

Typical Operating Circuit

Pin Configuration

1-Cell to 3-Cell, High-Power (1.5A), Low-Noise, Step-Up DC-DC Converter

ABSOLUTE MAXIMUM RATINGS

OUT, \overline{ON} , AO, POK to GND-0.3V to +6V
 PGND to GND±0.3V
 LXP, LXN to PGND-0.3V to (V_{POUT} + 0.3V)
 POUT, CLK/SEL, AIN, REF, FB,
 POKIN to GND-0.3V to (V_{OUT} + 0.3V)
 Continuous Power Dissipation (T_A = +70°C)
 Narrow SO (derate 8.70mW/°C above +70°C)696mW

Operating Temperature Range-40°C to +85°C
 Junction Temperature+150°C
 Storage Temperature Range-65°C to +160°C
 Lead Temperature (soldering, 10sec)+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

- Note 1:** Supply current from the 5.05V output is measured between the 5.05V output and the OUT pin. This current correlates directly to the actual battery supply current, but is reduced in value according to the step-up ratio and efficiency. Set V_{OUT} = 5.3V to keep the internal switch open when measuring the device operating current.
- Note 2:** Minimum operating voltage. Since the regulator is bootstrapped to the output, once started it will operate down to a 0.7V input.
- Note 3:** Start-up is tested with the circuit of Figure 2.
- Note 4:** In low-power mode (CLK/SEL = GND) the output voltage regulates 1% higher than low-noise mode (CLK/SEL = OUT or synchronized).
- Note 5:** The regulator is in start-up mode until this voltage is reached. Do not apply full-load current below this voltage.
- Note 6:** Load regulation is measured from no-load to full load, where full load is determined by the N-channel switch current limit.
- Note 7:** The $\overline{\text{ON}}$ input has a total hysteresis of approximately 0.15 × V_{OUT}.
- Note 8:** Specifications to -40°C are guaranteed by design and not production tested.

Pin Description

PIN	NAME	FUNCTION
1	REF	Reference Output. Bypass with a 0.22 μF bypass capacitor to GND.
2	FB	Dual-Mode™ Feedback Input. Connect FB to ground to set a fixed output voltage of +5V. Connect a divider between the output voltage and GND to set the output voltage from 2.5V to 5.5V.
3	POKIN	Power-Good Comparator Input. Threshold is 1.250V, with 1% hysteresis on the threshold's rising edge.
4	OUT	DC-DC Converter Output. Power source for the IC.
5	GND	Ground
6	AIN	Gain-Block Input. When AIN is low, AO sinks current. The nominal transconductance from AIN to AO is 10mmhos.
7	AO	Gain-Block Output. This open-drain output sinks current when $V_{AIN} < V_{REF}$.
8	POK	Power-Good Comparator Output. This open-drain N-channel output is low when $V_{POKIN} < 1.250V$.
9	CLK/SEL	Switch-Mode Selection and External-Clock Synchronization Input: <ul style="list-style-type: none"> • CLK/SEL = Low: Low-power, low-quiescent-current PFM mode. Delivers up to 10% of full load current. • CLK/SEL = High: High-power PWM mode. Full output power available. Operates in low-noise, constant-frequency mode. • CLK/SEL = External Clock: High-power PWM mode with the internal oscillator synchronized to the external CLK Turning on with CLK/SEL = 0V also serves as a soft-start function, since peak inductor current is limited to 25% of that allowed in PWM mode.
10, 12	PGND	Source of N-Channel Power MOSFET Switch
11	LXN	Drain of N-Channel Power Switch. Connect LXP to LXN.
13, 15	POUT	Source of P-Channel Synchronous Rectifier MOSFET Switch. Connect an external Schottky diode from LXN and LXP to POUT.
14	LXP	Drain of P-Channel Synchronous Rectifier. Connect LXP to LXN.
16	\overline{ON}	On/Off Input. When \overline{ON} is low, the IC turns on.

Dual Mode is a trademark of Maxim Integrated Products.

1-Cell to 3-Cell, High-Power (1.5A), Low-Noise, Step-Up DC-DC Converter

Figure 1. Functional Block Diagram

Detailed Description

The MAX1703 is a highly efficient, low-noise power supply for portable RF and data-acquisition instruments. It combines a boost switching regulator, N-channel power MOSFET, P-channel synchronous rectifier, precision reference, shutdown control, versatile gain block, and power-good (POK) comparator (Figure 1) in a 16-pin narrow SO package.

The switching DC-DC converter boosts a 1- to 3-cell input to a fixed 5V or an adjustable output between 2.5V and 5.5V. Typically the MAX1703 starts from a low, 0.9V input and remains operational down to 0.7V.

The MAX1703 is optimized for use in cellular phones and other applications requiring low noise during full-power operation, as well as low quiescent current for maximum battery life in low-power mode and shutdown. It features constant-frequency (300kHz), low-noise PWM operation with up to 1.5A output capability. See Table 1 for typical outputs. A low-quiescent-current, low-power mode offers an output up to 150mA and reduces quiescent power consumption to 300 μ W. In shutdown mode, the quiescent current is further reduced to just 1 μ A. Figure 2 shows the standard application circuit for the MAX1703.

1-Cell to 3-Cell, High-Power (1.5A), Low-Noise, Step-Up DC-DC Converter

Table 1. Typical Available Output Current

NO. OF CELLS	INPUT VOLTAGE (V)	OUTPUT VOLTAGE (V)	OUTPUT CURRENT (mA)
1 NiCd/NiMH	1.2	3.3	600
2 NiCd/NiMH	2.4	3.3	1400
	2.4	5.0	950
3 NiCd/NiMH	3.6	5.0	1600

Table 2. Selecting the Operating Mode

CLK/SEL	MODE	FEATURES
0	Low power	Low supply current
1	PWM	Low noise, high output current
External Clock (200kHz to 400kHz)	Synchronized PWM	Low noise, high output current

Figure 2. MAX1703 in High-Power PWM Mode

Additional features include synchronous rectification for high efficiency and improved battery life, and an uncommitted comparator (POK) for monitoring the regulator's output or battery voltage. The MAX1703 also includes a gain block that can be used to build a linear regulator using an external P-channel MOSFET pass device; this gain block can also function as a second comparator. A CLK input allows frequency synchronization to reduce interference.

Step-Up Converter

The step-up switching DC-DC converter generates an adjustable output from 2.5V to 5.5V. The internal N-channel MOSFET switch is turned on during the first part of each cycle, allowing current to ramp up in the inductor and store energy in a magnetic field. During the second part of each cycle, when the MOSFET is turned off, the voltage across the inductor reverses and forces current through the diode and synchronous rectifier to the output filter capacitor and load. As the energy stored in the inductor is depleted, the current ramps down and the output diode and synchronous rectifier turn off. Depending on the CLK/SEL pin setting, voltage across the load is regulated using either low-noise PWM or low-power operation (Table 2).

Low-Noise PWM Operation

When CLK/SEL is pulled high, the MAX1703 operates in a high-power, low-noise PWM mode. During PWM operation, the MAX1703 switches at a constant frequency (300kHz), and modulates the MOSFET-switch pulse width to control the power transferred per cycle and regulate the voltage across the load. In PWM mode the device can output up to 1.5A. Switching harmonics generated by fixed-frequency operation are consistent and easily filtered. See the Noise Spectrum plot in the *Typical Operating Characteristics*.

During PWM operation, each of the internal clock's rising edges sets a flip-flop, which turns on the N-channel MOSFET switch (Figure 3). The switch turns off when the sum of the voltage-error, slope-compensation, and current-feedback signals trips a multi-input comparator and resets the flip-flop; the switch remains off for the rest of the cycle. When a change occurs in the output voltage error signal, the comparator shifts the level to which the inductor current ramps during each cycle. A second comparator enforces an inductor current limit of 2.7A (typical).

1-Cell to 3-Cell, High-Power (1.5A), Low-Noise, Step-Up DC-DC Converter

Figure 3. Simplified PWM Controller Block Diagram

Synchronized PWM Operation

The MAX1703 can be synchronized in PWM mode to a 200kHz to 400kHz frequency by applying an external clock to CLK/SEL. This allows the user to set the harmonics to avoid IF bands in wireless applications. The synchronous rectifier is also active during synchronized PWM operation.

Low-Power PFM Operation

Pulling CLK/SEL low places the MAX1703 in a low-power mode. During low-power mode, PFM operation regulates the output voltage by transferring a fixed amount of energy during each cycle, and then modulating the pulse frequency to control the power delivered to the output. The device switches only as needed to service the load, resulting in the highest possible efficiency at light loads. Output current capability in PFM mode is 150mA (max). The output voltage is typically 1% higher than in PWM mode.

During PFM operation, the error comparator detects the output voltage falling out of regulation and sets a flip-flop, which turns on the N-channel MOSFET switch (Figure 4). When the inductor current ramps to the PFM mode current limit (800mA typical) and stores a fixed amount of energy, the current-sense comparator resets a flip-flop. The flip-flop turns off the N-channel switch and turns on the P-channel synchronous rectifier. A second flip-flop, previously reset by the switch's "on" sig-

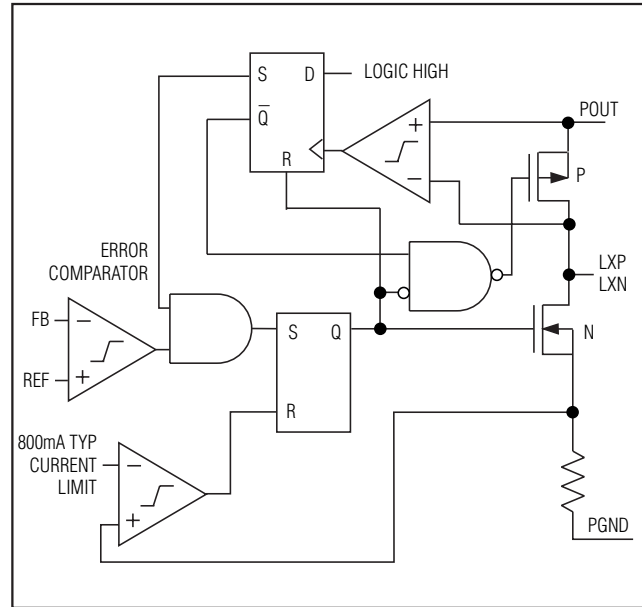

Figure 4. Controller Block Diagram in Low-Power PFM Mode

nal, inhibits the error comparator from initiating another cycle until the energy stored in the inductor is transferred to the output filter capacitor and the synchronous rectifier current has ramped down to 80mA. This forces operation with a discontinuous inductor current.

Synchronous Rectifier

The MAX1703 features an internal 140mΩ, P-channel synchronous rectifier to enhance efficiency. Synchronous rectification provides a 5% efficiency improvement over similar nonsynchronous boost regulators. In PWM mode, the synchronous rectifier is turned on during the second half of each switching cycle. In low-power mode, an internal comparator turns on the synchronous rectifier when the voltage at LX exceeds the boost regulator output, and then turns it off when the inductor current drops below 80mA.

Low-Voltage Start-Up Oscillator

The MAX1703 uses a CMOS, low-voltage start-up oscillator for a 1.1V guaranteed minimum start-up input voltage at +25°C. On start-up, the low-voltage oscillator switches the N-channel MOSFET until the output voltage reaches 2.15V. Above this level, the normal boost-converter feedback and control circuitry take over. Once the device is in regulation, it can operate down to a 0.7V input, since internal power for the IC is bootstrapped from the output via the OUT pin. Do not apply full load until the output exceeds 2.3V (max).

1-Cell to 3-Cell, High-Power (1.5A), Low-Noise, Step-Up DC-DC Converter

Shutdown

The MAX1703 shuts down to reduce quiescent current to 1µA. During shutdown ($\overline{\text{ON}} = \text{V}_{\text{OUT}}$), the reference, low-battery comparator, gain block, and all feedback and control circuitry are off. The boost converter's output drops to one Schottky diode drop below the input.

Power-Good (POK) Comparator

The MAX1703 features an uncommitted POK comparator. The internal POK comparator has an open-drain output (POK) capable of sinking 1mA. When the input (POKIN) rises above the 1.25V reference, the POK open-drain output turns off. The POKIN input has 10mV of hysteresis.

To provide a power-good signal, connect the POKIN input to an external resistor-divider between OUT and GND (Figure 5). Calculate the resistor values as follows:

$$R3 = R4(V_{\text{TH}} / V_{\text{REF}} - 1)$$

where V_{TH} is the desired input voltage trip threshold.

Since the input bias current into POKIN is less than 20nA, R4 can be a large value (such as 270kΩ or less) without sacrificing accuracy. Connect the resistor voltage-divider as close to the IC as possible, within 0.2in. (5mm) of POKIN.

Figure 5. Adjustable Output (PWM Mode)

Reference

The MAX1703 has an internal 1.250V, 1% bandgap reference. Connect a 0.22µF bypass capacitor to GND within 0.2in. (5mm) of the REF pin. REF can source up to 50µA of external load current.

Gain Block

The MAX1703 gain block can function as a second comparator, or can be used to build a linear regulator using an external P-channel MOSFET pass device. The gain-block output is a single-stage transconductance amplifier that drives an open-drain N-channel MOSFET. The g_m of the entire gain-block stage is 10mmho. Figure 6 shows the gain block used in a linear-regulator application. The output of an external P-channel pass element is compared to the internal reference. The difference is amplified and used to drive the gate of the pass element. Use a logic-level PFET, such as an NDS336P ($R_{\text{DS(ON)}} = 270\text{m}\Omega$) from Fairchild. This configuration allows ripple reduction at the output. If a lower $R_{\text{DS(ON)}}$ PFET is used, then the linear regulator output filter capacitance may need to be increased.

To use the gain block as a comparator, refer to the *Power-Good (POK) Comparator* section.

Figure 6. Using the Gain Block as a Linear Regulator

1-Cell to 3-Cell, High-Power (1.5A), Low-Noise, Step-Up DC-DC Converter

Table 3. Component Selection Guide

PRODUCTION	INDUCTORS	CAPACITORS	DIODES
Surface Mount	Sumida CDR125	Matsuo 267 series	Motorola MBR0520L

Through Hole	Sumida RCH654 series	Sanyo OS-CON series	1N5817
		Nichicon PL series	

Design Procedure

Setting the Output Voltages

Set the output voltage between 2.5V and 5.5V by connecting a resistor voltage-divider to FB from OUT to GND, as shown in Figure 2. The resistor values are then as follows:

$$R1 = R2(V_{OUT} / V_{FB} - 1)$$

where V_{FB} , the boost-regulator feedback setpoint, is 1.24V. Since the input bias current into FB is less than 20nA, R2 can have a large value (such as 270k Ω or less) without sacrificing accuracy. Connect the resistor voltage-divider as close to the IC as possible, within 0.2in. (5mm) of the FB pin.

Inductor Selection

The MAX1703's high switching frequency allows the use of a small surface-mount inductor. A 4.7 μ H inductor should have a saturation-current rating that exceeds the N-channel switch current limit. However, it is generally acceptable to bias the inductor current into saturation by as much as 20%, although this will slightly reduce efficiency. For high efficiency, choose an inductor with a high-frequency core material, such as ferrite, to reduce core losses. To minimize radiated noise, use a toroid, pot core, or shielded bobbin inductor. See Table 3 for suggested components and Table 4 for a list of component suppliers. Connect the inductor from the battery to the LX pins as close to the IC as possible.

Output Diode

Use a Schottky diode such as a 1N5817, MBR0520L, or equivalent. The Schottky diode carries current during both start-up and PFM mode after the synchronous rectifier turns off. Thus, its current rating only needs to be 500mA. Connect the diode between LXN/LXP and POUT, as close to the IC as possible. Do not use ordinary rectifier diodes, since slow switching speeds and long reverse recovery times will compromise efficiency and load regulation.

Input and Output Filter Capacitors

Choose input and output filter capacitors that will service the input and output peak currents with acceptable voltage ripple. Choose input capacitors with working voltage ratings over the maximum input voltage, and output capacitors with working voltage ratings higher than the output.

A 330 μ F, 100m Ω , low-ESR tantalum capacitor is recommended for a 5V output. For full output load current, one 470 μ F or two 220 μ F, 100m Ω low-ESR tantalum capacitors are recommended for a 3.3V output. The input filter capacitor (C_{IN}) also reduces peak currents drawn from the input source and reduces input switching noise. The input voltage source impedance determines the required size of the input capacitor.

When operating directly from one or two NiCd cells placed close to the MAX1703, use a 100 μ F, low-ESR input filter capacitor.

Sanyo OS-CON and Panasonic SP/CB-series ceramic capacitors offer the lowest ESR. Low-ESR tantalum capacitors are a good choice and generally offer a good tradeoff between price and performance. Do not exceed the ripple current ratings of tantalum capacitors. Avoid most aluminum-electrolytic capacitors, because their ESR is often too high.

1-Cell to 3-Cell, High-Power (1.5A), Low-Noise, Step-Up DC-DC Converter

NOTES

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
