Telecom microcontrollers

PCF84C21A; PCF84C41A;
PCF84C81A**1 FEATURES**

- Manufactured in silicon gate CMOS process
- 8-bit CPU, ROM, RAM, I/O in a 28-lead package
- 2 kbyte ROM, 64 byte RAM (PCF84C21A)
- 4 kbyte ROM, 128 byte RAM (PCF84C41A)
- 8 kbyte ROM, 256 byte RAM (PCF84C81A)
- I²C-bus interface with multi-master capability
- Over 100 instructions (based on MAB8048) all of 1 or 2 cycles
- 20 quasi-bidirectional I/O Port lines
- High sink current capability on the 8 lines of Port 1
- 8-bit programmable timer/event counter 1
- 3 single-level vectored interrupts:
 - external
 - 8-bit programmable timer/event counter 1
 - I²C-bus
- Two test inputs, one of which also serves as the external interrupt input
- Stop and Idle modes
- Supply voltage: 2.5 to 5.5 V
- Clock frequency: 1 to 16 MHz
- Operating temperature: –40 to +85 °C.

2 GENERAL DESCRIPTION

This data sheet details the specific properties of the PCF84C21A, PCF84C41A and PCF84C81A. The shared properties of the PCF84CxxxA family of microcontrollers are described in the “PCF84CxxxA family” data sheet which should be read in conjunction with this publication.

The PCF84C21A, PCF84C41A and PCF84C81A are general purpose CMOS microcontrollers with 2 kbytes, 4 kbytes and 8 kbytes of program memory and 64, 128 and 256 bytes of RAM, respectively. In addition to 20 I/O port lines, the microcontrollers provide an on-chip I²C-bus interface. This two-line serial bus extends the microcontroller capabilities when implemented with the powerful I²C-bus peripherals. These include LCD drivers, I/O expanders, telecom circuits, ADC and DAC converters, clock/calendar circuits, EEPROM and RAM and are listed in “Data Handbook IC12, I²C Peripherals”.

The instruction set is based on that of the MAB8048 and is a sub-set of that listed in the “PCF84CxxxA family” data sheet.

6 INSTRUCTION SET

ROM is restricted to 2 kbytes for the PCF84C21A and 4 kbytes for the PCF84C41A. Therefore, the instructions SEL MB1/2/3 for the PCF84C21A, and the instructions SEL MB2/3 for the PCF84C41A should be avoided, as they would define non-existing program memory banks.

As RAM is limited to 64 bytes for the PCF84C21A and to 128 bytes for the PCF84C41A, care should be taken to avoid accesses to non-existing RAM locations.

See the “PCF84CxxxA family” data sheet for a complete description of the instruction set.

7 HIGH SINK OUTPUT CURRENTS

The Port 1 outputs of these devices are designed for high current drive in the logic 0 state. They are capable of driving 10 mA loads and higher. Applications include drive for small relays and light-emitting diodes (LEDs).

To avoid overload, care should be taken that the total Port 1 current averages less than 80 mA, i.e. an average of 10 mA per Port 1 line. Refer to Chapter “Limiting values” which specifies an upper limit of 100 mA for I_{SS}.

Notes

1. DF stands for Division Factor: the divisor of f_{xtal} (see the “PCF84CxxxA family” data sheet).

2. Values given for ASC = 0; for ASC = 1: $t_{HIGH} = \frac{3(DF + 1)}{4 \times f_{xtal}}$; $t_{LOW} = \frac{DF - 3}{4 \times f_{xtal}}$

3. Determined by I²C-bus capacitance (C_b) and external pull-up resistor.

4. At maximum allowed I²C-bus capacitance $C_b = 400$ pF.

5. Determined by program.

6. If $t_{LOW} < \frac{24}{f_{xtal}}$, $t_{SU;DAT} \geq \frac{t_{LOW} - 9}{f_{xtal}}$, independent of ASC.

PCF84C81A**14 SOLDERING****14.1 Introduction**

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"IC Package Databook"* (order code 9398 652 90011).

14.2 DIP**14.2.1 SOLDERING BY DIPPING OR BY WAVE**

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ($T_{stg\ max}$). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

14.2.2 REPAIRING SOLDERED JOINTS

Apply a low voltage soldering iron (less than 24 V) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

14.3 SO**14.3.1 REFLOW SOLDERING**

Reflow soldering techniques are suitable for all SO packages.

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt. Dwell times vary between 50 and 300 seconds depending on heating method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 minutes at 45 °C.

14.3.2 WAVE SOLDERING

Wave soldering techniques can be used for all SO packages if the following conditions are observed:

- A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.
- The longitudinal axis of the package footprint must be parallel to the solder flow.
- The package footprint must incorporate solder thieves at the downstream end.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

14.3.3 REPAIRING SOLDERED JOINTS

Fix the component by first soldering two diagonally-opposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

16 LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

17 PURCHASE OF PHILIPS I²C COMPONENTS

Purchase of Philips I²C components conveys a license under the Philips' I²C patent to use the components in the I²C system provided the system conforms to the I²C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.
