- **Two- and Three-Operand Instructions**
- **Parallel Arithmetic Logic Unit (ALU) and Multiplier Execution in a Single Cycle**
- **Block-Repeat Capability**
- **Zero-Overhead Loops With Single-Cycle Branches**
- **Conditional Calls and Returns**
- **Interlocked Instructions for Multiprocessing Support**
- **One External Pin, PRGW, That Configures the External-Program-Memory Width to 16 or 32 Bits**
- **Two Sets of Memory Strokes ($\overline{\text{STRB0}}$ and $\overline{\text{STRB1}}$) and One I/O Strobe ($\overline{\text{IOSTRB}}$) Allow Zero-Glue Logic Interface to Two Banks of Memory and One Bank of External Peripherals**
- **Separate Bus-Control Registers for Each Strobe-Control Wait-State Generation, External Memory Width, and Data Type Size**
- **$\overline{\text{STRB0}}$ and $\overline{\text{STRB1}}$ Memory Strokes Handle 8-, 16-, or 32-Bit External Data Accesses (Reads and Writes)**
- **Multiprocessor Support Through the $\overline{\text{HOLD}}$ and $\overline{\text{HOLDA}}$ Signals Is Valid for All Strokes**

description

The TMS320C32 is the newest member of the TMS320C3x generation of digital signal processors (DSPs) from Texas Instruments. The TMS320C32 is an enhanced 32-bit floating-point processor manufactured in 0.7-μm triple-level-metal CMOS technology. The enhancements to the TMS320C3x architecture include a variable-width external-memory interface, faster instruction cycle time, power-down modes, two-channel DMA coprocessor with configurable priorities, flexible boot loader, relocatable interrupt-vector table, and edge- or level-triggered interrupts.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

EPIC and TI are trademarks of Texas Instruments Incorporated.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

pin functions

This section provides signal descriptions for the TMS320C32 device. The following table lists each signal, the number of pins, operating modes, and a brief signal description. The following table groups the signals according to their function.

TMS320C32 Pin Functions

| PIN NAME | NO. | TYPE† | DESCRIPTION | CONDITIONS WHEN SIGNAL IS IN HIGH Z‡ |
|---|-----|-------|---|---|
| EXTERNAL-BUS INTERFACE (70 PINS) | | | | |
| A23–A0 | 24 | O/Z | 24-bit address port of the external-bus interface | S H R |
| D31–D0 | 32 | I/O/Z | 32-bit data port of the external-bus interface | S H R |
| R/ \overline{W} | 1 | O/Z | Read/write for external-memory interface. R/ \overline{W} is high when a read is performed and low when a write is performed over the parallel interface. | S H |
| \overline{IOSTRB} | 1 | O/Z | External-peripheral I/O strobe for the external-memory interface | S H |
| $\overline{STRB0_B3/A_1}$ | 1 | O/Z | External-memory access strobe 0, byte enable 3 for 32-bit external-memory interface, and address pin for 8-bit and 16-bit external-memory interface | S H |
| $\overline{STRB0_B2/A_2}$ | 1 | O/Z | External-memory access strobe 0, byte enable 2 for 32-bit external-memory interface, and address pin for 8-bit external-memory interface | S H |
| $\overline{STRB0_B1}$ | 1 | O/Z | External-memory access strobe 0, byte enable 1 for the external-memory interface | S H |
| $\overline{STRB0_B0}$ | 1 | O/Z | External-memory access strobe 0, byte enable 0 for the external-memory interface | S H |
| $\overline{STRB1_B3/A_1}$ | 1 | O/Z | External-memory access strobe 1, byte enable 3 for 32-bit external-memory interface, and address pin for 8-bit and 16-bit external-memory interface | S H |
| $\overline{STRB1_B2/A_2}$ | 1 | O/Z | External-memory access strobe 1, byte enable 2 for 32-bit external-memory interface, and address pin for 8-bit external-memory interface | S H |
| $\overline{STRB1_B1}$ | 1 | O/Z | External-memory access strobe 1, byte enable 1 for the external-memory interface | S H |
| $\overline{STRB1_B0}$ | 1 | O/Z | External-memory access strobe 1, byte enable 0 for the external-memory interface | S H |
| \overline{RDY} | 1 | I | Ready. \overline{RDY} indicates that the external device is prepared for an external-memory interface transaction to complete. | |
| \overline{HOLD} | 1 | I | Hold signal for external-memory interface. When \overline{HOLD} is a logic low, any ongoing transaction is completed. A23–A0, D31–D0, \overline{IOSTRB} , $\overline{STRB0_Bx}$, $\overline{STRB1_Bx}$, and R/ \overline{W} are placed in the high-impedance state, and all transactions over the external-memory interface are held until \overline{HOLD} becomes a logic high or the NOHOLD bit of the STRB0 bus-control register is set. | |
| \overline{HOLDA} | 1 | O/Z | Hold acknowledge for external-memory interface. \overline{HOLDA} is generated in response to a logic low on \overline{HOLD} . \overline{HOLDA} indicates that A23–A0, D31–D0, \overline{IOSTRB} , $\overline{STRB0_Bx}$, $\overline{STRB1_Bx}$, and R/ \overline{W} are in the high-impedance state and that all transactions over the memory are held. \overline{HOLDA} is high in response to a logic high of \overline{HOLD} or when the NOHOLD bit of the external bus-control register is set. | S |
| PRGW | 1 | I | Program memory width select. When PRGW is a logic low, program is fetched as a single 32-bit word. When PRGW is a logic high, two 16-bit program fetches are performed to fetch a single 32-bit instruction word. The status of PRGW at device reset affects the reset value of the STRB0 and STRB1 bus-control register. | |
| A23–A0 | 24 | O/Z | 24-bit address port of the external-bus interface | S H R |

† I = input, O = output, Z = high-impedance state

‡ S = SHZ active, H = HOLD active, R = RESET active

POST OFFICE BOX 1443 • HOUSTON, TEXAS 77251-1443

TMS320C32 Pin Functions (Continued)

| PIN NAME | NO. | TYPE† | DESCRIPTION | CONDITIONS WHEN SIGNAL IS IN HIGH Z‡ | |
|------------------------------|-----|-------|---|---|---|
| CONTROL SIGNALS (9 PINS) | | | | | |
| RESET | 1 | I | Reset. When RESET is a logic low, the device is in the reset condition. When RESET becomes a logic high, execution begins from the location specified by the reset vector. | | |
| INT3–INT0 | 4 | I | External interrupts | | |
| IACK | 1 | O/Z | Interrupt acknowledge. IACK is generated by the IACK instruction. This signal can be used to indicate the beginning or end of an interrupt-service routine. | S | |
| MCBL/MP | 1 | I | Microcomputer boot loader/microprocessor mode | | |
| XF1–XF0 | 2 | I/O/Z | External flags. XF1 and XF0 are used as general-purpose I/Os or used to support interlocked-processor instructions. | S | R |
| SERIAL PORT SIGNALS (6 PINS) | | | | | |
| CLKX0 | 1 | I/O/Z | Serial-port 0 transmit clock. CLKX0 is the serial shift clock for the serial port 0 transmitter. | S | R |
| DX0 | 1 | I/O/Z | Data-transmit output. Serial port 0 transmits serial data on DX0. | S | R |
| FSX0 | 1 | I/O/Z | Frame-synchronization pulse for transmit. The FSX0 pulse initiates the transmit-data process over DX0. | S | R |
| CLKR0 | 1 | I/O/Z | Serial-port 0 receive clock. CLKR0 is the serial-shift clock for the serial-port 0 receiver. | S | R |
| DR0 | 1 | I/O/Z | Data receive. Serial port 0 receives serial data on DR0. | S | R |
| FSR0 | 1 | I/O/Z | Frame-synchronization pulse for receive. The FSR0 pulse initiates the receive-data process over DR0. | S | R |
| TIMER SIGNALS (2 PINS) | | | | | |
| TCLK0 | 1 | I/O/Z | Timer clock 0. As an input, TCLK0 is used by timer 0 to count external pulses. As an output, TCLK0 outputs pulses generated by timer 0. | S | R |
| TCLK1 | 1 | I/O/Z | Timer clock 1. As an input, TCLK1 is used by timer 1 to count external pulses. As an output, TCLK1 outputs pulses generated by timer 1. | S | R |
| CLOCK SIGNALS (3 PINS) | | | | | |
| CLKIN | 1 | I | Input to the internal oscillator from an external clock source | | |
| H1 | 1 | O/Z | External H1 clock. H1 has a period equal to twice CLKIN. | S | |
| H3 | 1 | O/Z | External H3 clock. H3 has a period equal to twice CLKIN. | S | |
| RESERVED (5 PINS) | | | | | |
| EMU0–EMU2 | 3 | I | Reserved for emulation. Use 18 kΩ–22 kΩ pullup resistors to 5 V. | | |
| EMU3 | 1 | O/Z | Reserved for emulation | S | |
| SHZ | 1 | I | Shutdown high impedance. When active, SHZ shuts down the 'C32 and places all 3-state I/O pins in the high-impedance state. SHZ is used for board-level testing to ensure that no dual-drive conditions occur. CAUTION: A low on SHZ corrupts 'C32 memory and register contents. Reset the device with SHZ high to restore it to a known operating condition. | | |

functional block diagram

operation

Operation of the TMS320C32 is identical to the TMS320C30 and TMS320C31 digital signal processors, with the exception of an enhanced external memory interface and the addition of two CPU power-management modes.

external-memory interface

The TMS320C32 has a configurable external-memory interface with a 24-bit address bus, a 32-bit data bus, and three independent multifunction strobes. The flexibility of this unique interface enables product designers to minimize external-memory chip count.

external memory interface (continued)

Up to three mutually exclusive memory areas (one program area and two data areas) can be implemented. Each memory area configuration is independent of the physical memory width and independent of the configuration of other memory areas. See Figure 1.

Figure 1. 'C32 External Memory Interface

The TMS320C32's external-memory configuration is controlled by a combination of hardware configuration and memory-mapped control registers and can be reconfigured dynamically. The signals that control external-memory configuration are the PRGW, STRB0, STRB1, and IOSTRB. The signals work as follows:

- The TMS320C32 is a 32-bit microprocessor, that is, the CPU operates on 32-bit program words. The external-memory interface provides the capability of fetching instructions as either 32-bit words or two 16-bit half words from consecutive addresses. Program memory width is 16 bits if the PRGW signal is high, 32 bits if the PRGW signal is low.
- STRB0 and STRB1 are sets of control signals, four signals each, that are mapped to specific ranges of external-memory addresses. When an address within one of these ranges is accessed by a read or write instruction (CPU or DMA), the corresponding set of control signals is activated. Figure 8 illustrates the TMS320C32 memory map, showing the address ranges for which the strobe signals become active.

The behavior of the STRB0 and STRB1 control signals is determined by the contents of the STRB0 and STRB1 control registers.

The STRB0 and STRB1 control registers each have a field that specifies the physical memory width (8, 16, or 32 bits) of the external-memory address ranges they control. Another field specifies the data width (8, 16, or 32 bits) of the data contained in those addresses. The values in these fields are not required to match. For example, a 32-bit-wide physical memory space can be configured to segment each 32-bit word into four consecutive 8-bit locations, each having its own address.

Each control-signal set has two pins (STRBx_B2/A_2 and STRBx_B3/A_4) that can act as either byte-enable (chip-select) pins or address pins, and two dedicated byte-enable (chip-select) pins (STRBx_B0 and STRBx_B1). The pin functions are determined by the physical memory width specified in the corresponding control register.

external memory interface (continued)

- For 8-bit-wide physical memory, the $\overline{\text{STRBx_B2/A_2}}$ and $\overline{\text{STRBx_B3/A_1}}$ pins function as address pins (least significant address bits) and the $\overline{\text{STRBx_B0}}$ pin functions as a byte-enable (chip-select) pin. $\overline{\text{STRBx_B1}}$ is unused. See Figure 2.

Figure 2. 'C32 With 8-Bit-Wide External Memory

- For 16-bit-wide physical memory, the $\overline{\text{STRBx_B3/A_1}}$ pin functions as an address pin (least significant address bits). The $\overline{\text{STRBx_B0}}$ and $\overline{\text{STRBx_B1}}$ pins function as byte-enable (chip-select) pins. $\overline{\text{STRBx_B2/A_2}}$ is unused. See Figure 3.

Figure 3. 'C32 With 16-Bit-Wide External Memory

TMS320C32 DIGITAL SIGNAL PROCESSOR

SPRS027C – JANUARY 1995 – REVISED DECEMBER 1996

external memory interface (continued)

- For 32-bit-wide physical memory, all $\overline{\text{STRB0}}$ and $\overline{\text{STRB1}}$ pins function as byte-enable (chip-select) pins. See Figure 4.

Figure 4. 'C32 With 32-Bit-Wide External Memory

For more detailed information and examples see *TMS320C32 Addendum to the TMS320C3x User's Guide* (literature number SPRU132) and *Interfacing Memory to the TMS320C32 DSP Application Report* (literature number SPRA040).

- The $\overline{\text{IOSTRB}}$ control signal, like $\overline{\text{STRB0}}$ and $\overline{\text{STRB1}}$, also is mapped to a specific range of addresses but it is a single signal that can access only 32-bit data from 32-bit-wide memory. Its range of addresses appears in the TMS320C32 memory map, shown in Figure 8. The $\overline{\text{IOSTRB}}$ bus timing is different from the $\overline{\text{STRB0}}$ and $\overline{\text{STRB1}}$ bus timings to accommodate slower I/O peripherals.

external memory interface (continued)

examples

Figure 5 and Figure 6 show examples of external memory configurations that can be implemented using the TMS320C32 external memory interface. The first example has a 32-bit-wide external memory with 8- and 16-bit data areas and a 32-bit program area.

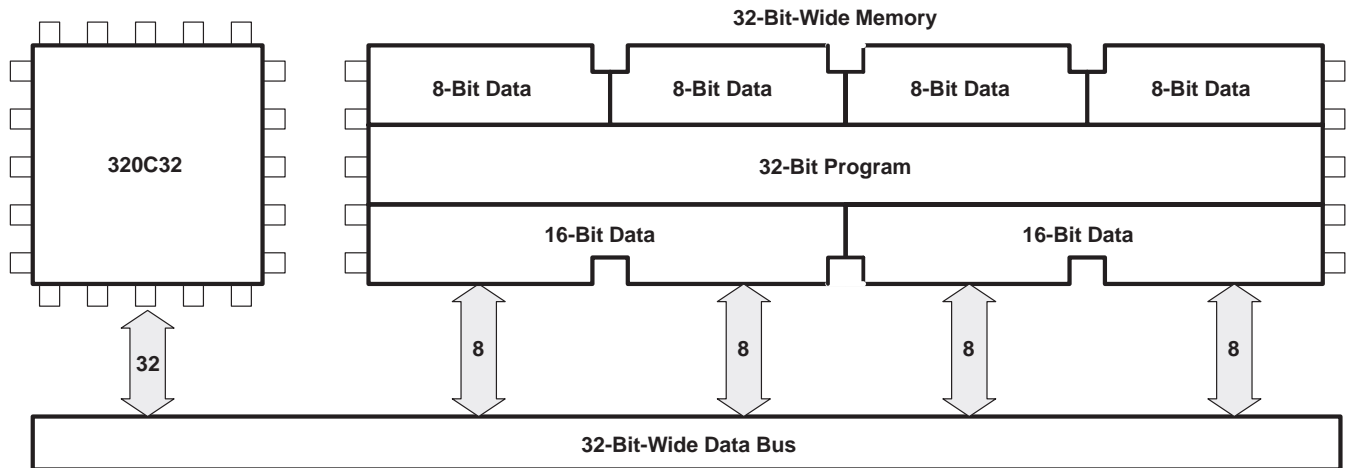

Figure 5. 32-Bit-Wide External Memory Configured With 8- and 16-Bit Data Areas and 32-Bit Program Memory

Figure 6 shows a configuration that can be implemented with 16-bit external memory. The 32-bit data and program words can be stored and retrieved as half-words.

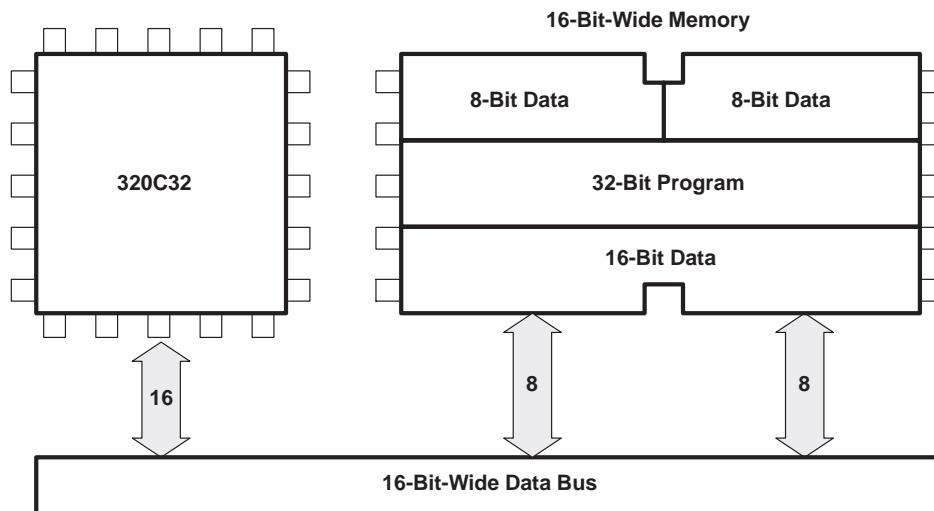

Figure 6. 16-Bit-Wide External Memory Configured With 8- and 16-Bit Data Areas and a 32-Bit Program Area

TMS320C32 DIGITAL SIGNAL PROCESSOR

SPRS027C – JANUARY 1995 – REVISED DECEMBER 1996

external memory interface (continued)

Figure 7 shows one possible configuration that can be implemented with 8-bit external memory. Program words, which are 32-bit, cannot be executed from 8-bit-wide memory.

Figure 7. 8-Bit-Wide External Memory Configured With 8- and 16-Bit Data Areas

memory map

Figure 8 depicts the memory map for the TMS320C32. Refer to the TMS320C32 Addendum to the *TMS320C3x User's Guide* (literature number SPRU132) for a detailed description of this memory mapping, with shading to indicate external memory.

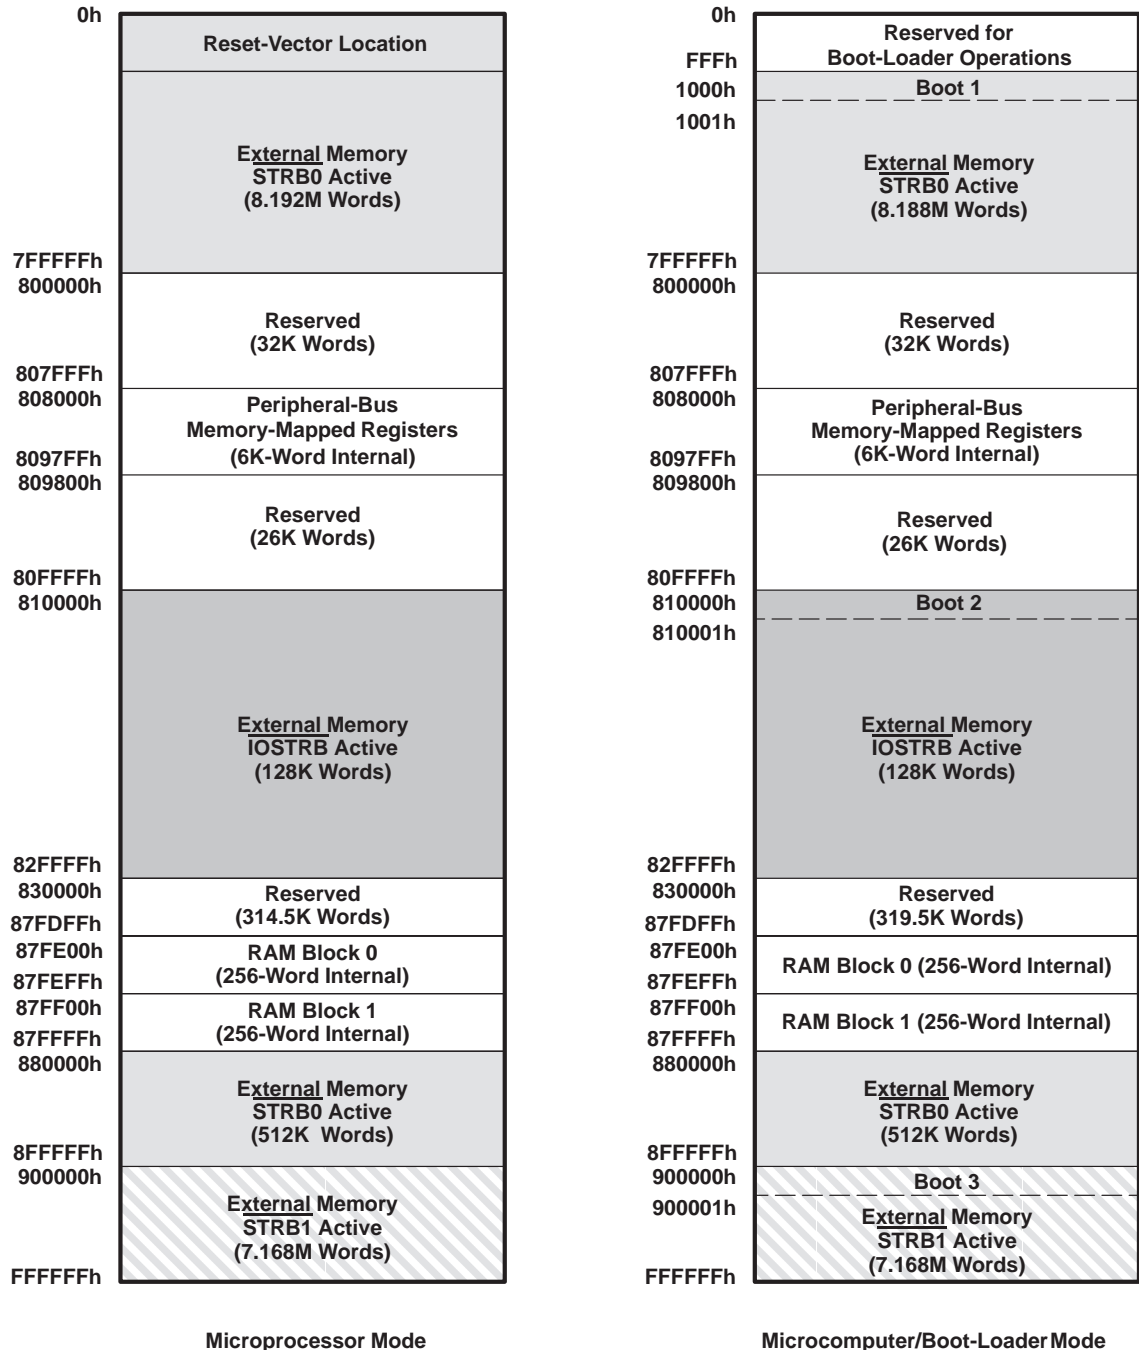

Figure 8. TMS320C32 Memory Map

TMS320C32

DIGITAL SIGNAL PROCESSOR

SPRS027C – JANUARY 1995 – REVISED DECEMBER 1996

power management

The TMS320C32 CPU has two power-management modes, IDLE2 and LOPOWER (low power). In IDLE2 mode, no instructions are executed and the CPU, peripherals, and memory retain their previous state while the external bus output pins are idle. During IDLE2 mode, the H1 clock signal is held high while the H3 clock signal is held low until one of the four external interrupts is asserted. In the LOPOWER mode, the CPU continues to execute instructions and the DMA continues to perform transfers, but at a reduced clock rate of the CLKIN frequency divided by 16 (that is, TMS320C32 with a 32-MHz CLKIN frequency performs the same as a 2-MHz TMS320C32 with an instruction cycle time of 1000 ns (1 MHz).

boot loader

The TMS320C32 flexible boot loader loads programs from the serial port, EPROM, or other standard non-volatile memory device. The boot-loader functionality of the TMS320C32 is equivalent to that of the TMS320C31, and has added modes to handle the data-type sizes and memory widths supported by the external memory interface. The memory-boot load supports data transfers with and without handshaking. The handshake mode allows synchronous transfer of programs by using two pins as data-acknowledge and data-ready signals.

peripherals

The TMS320C32 peripherals are composed of one serial port, two timers, and two DMA channels. The serial port and timers are the functional equivalent of those in the TMS320C31 peripherals. The TMS320C32 two-channel DMA coprocessor has user-configurable priorities: CPU, DMA, or rotating between CPU and DMA.

peripherals (continued)

Figure 9 shows the TMS320C32's peripheral-bus control-register mapping, with the reserved areas shaded.

interrupts

To reduce external logic and simplify the interface, the external interrupts can be either edge- or level-triggered. Unlike the fixed interrupt-trap vector-table location of the TMS320C30 and TMS320C31 devices, the TMS320C32 has a user-relocatable interrupt-trap vector table. The interrupt-trap vector table must start on a 256-word boundary. Figure 10 shows the interrupt and trap vector locations memory mapping with shading to indicate reserved areas. The reset vector is fixed to address 0h as shown in Figure 8.

Figure 10. Reset, Interrupt, and Trap Vector/Branches Memory-Map Locations

absolute maximum ratings over specified temperature ranges (unless otherwise noted)[†]

| | |
|--|----------------|
| Supply voltage range, V_{CC} (see Note 1) | –0.3 V to 7 V |
| Input voltage range | –0.3 V to 7 V |
| Output voltage range, V_O | –0.3 V to 7 V |
| Continuous power dissipation (see Note 2) | 1.95 W |
| Operating case temperature, T_C (PCM (commercial)) | 0°C to 85°C |
| (PCMA (extended)) | –40°C to 125°C |
| Storage temperature range, T_{stg} | –55°C to 150°C |

[†] Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. All voltage values are with respect to V_{SS} .

2. This value calculated for the 'C32-40. Actual operating power is less. This value was obtained under specially produced worst-case test conditions which are not sustained during normal device operation. These conditions consist of continuous parallel writes of a checkerboard pattern to the external bus at the maximum rate possible. See normal (I_{DD}) current specification in the electrical characteristics table and refer the *Calculation of TMS320C30 Power Dissipation Application Report* (literature number SPRU031).

recommended operating conditions (see Note 3)[‡]

| | | | MIN | NOM [‡] | MAX | UNIT |
|-----------------|---|------------------|--------------------|------------------------------------|------|------|
| V _{DD} | Supply voltage (DV _{DD} , V _{DDL}) | | 4.75 | 5 | 5.25 | V |
| V _{SS} | Supply voltage (CV _{SS} , V _{SSL} , IV _{SS} , DV _{SS} , V _{SUBS}) | | 0 | | | V |
| V _{IH} | High-level input voltage | CLKIN | 2.6 | V _{DD} + 0.3 [§] | | V |
| | | All other inputs | 2 | V _{DD} + 0.3 [§] | | V |
| V _{IL} | Low-level input voltage | | − 0.3 [§] | | 0.8 | V |
| I _{OH} | High-level output current | | − 300 | | | μA |
| I _{OL} | Low-level output current | | 2 | | | mA |
| T _C | Operating case temperature (commercial) | | 0 | 85 | | °C |
| | Operating case temperature (extended) | | − 40 | 125 | | °C |

[‡] All nominal values are at $V_{DD} = 5$ V, T_A (ambient air temperature) = 25°C.

§ These values are derived from characterization and not tested.

NOTE 3: All input and output voltage levels are TTL compatible.

TMS320C32

DIGITAL SIGNAL PROCESSOR

SPRS027C – JANUARY 1995 – REVISED DECEMBER 1996

electrical characteristics over recommended ranges of supply voltage (unless otherwise noted)^{†‡}

| PARAMETER | | TEST CONDITIONS | MIN | NOM | MAX | UNIT |
|-----------------|-------------------------------------|---|------|-----|------------------|------|
| V _{OH} | High-level output voltage | V _{DD} = MIN, I _{OH} = MAX | 2.4 | 3 | | V |
| V _{OL} | Low-level output voltage | V _{DD} = MIN, I _{OL} = MAX | | 0.3 | 0.6 [§] | V |
| I _{OZ} | High-impedance state output current | V _{DD} = MAX | – 20 | | 20 | μA |
| I _I | Input current | V _I = V _{SS} to V _{DD} | – 10 | | 10 | μA |
| I _{DD} | Supply current (see Note 4) | f _x = 40 MHz | | 160 | 390 | mA |
| | | f _x = 50 MHz | | 200 | 425 | |
| | | f _x = 60 MHz | | 225 | 475 | |
| | | Standby | | 50 | | μA |
| C _I | Input capacitance | All other inputs | | | 15 [¶] | pF |
| C _O | Output capacitance | | | | 20 [¶] | pF |

[†] All nominal values are at V_{DD} = 5 V, T_A (ambient air temperature) = 25°C.

[‡] f_x is the input clock frequency.

[§] V_{OL(max)} = 0.7 V for A(0:23)

[¶] Assured by design but not tested

NOTE 4: Actual operating current is less than this maximum value (reference Note 2).

PARAMETER MEASUREMENT INFORMATION

Where: I_{OL} = 2 mA (all outputs)
 I_{OH} = 300 μA (all outputs)
 V_{Load} = 2.15 V
 C_T = 80-pF typical load-circuit capacitance

Figure 11. Test Load Circuit

PARAMETER MEASUREMENT INFORMATION (CONTINUED)

signal-transition levels for 'C32 (see Figure 12 and Figure 13)

TTL-level outputs are driven to a minimum logic-high level of 2.4 V and to a maximum logic-low level of 0.6 V. Output transition times are specified in the following paragraph.

For a high-to-low transition on an output signal, the level at which the output is said to be no longer high is 2 V and the level at which the output is said to be low is 1 V. For a low-to-high transition, the level at which the output is said to be no longer low is 1 V and the level at which the output is said to be high is 2 V (see Figure 12).

Figure 12. 'C32 Output Levels

Transition times for TTL-compatible inputs are specified as follows. For a high-to-low transition on an input signal, the level at which the input is said to be no longer high is 2 V and the level at which the input is said to be low is 0.8 V. For a low-to-high transition on an input signal, the level at which the input is said to be no longer low is 0.8 V and the level at which the input is said to be high is 2 V (see Figure 13).

Figure 13. 'C32 Input Levels

PARAMETER MEASUREMENT INFORMATION (CONTINUED)

timing parameter symbology

Timing parameter symbols used in this document are in accordance with JEDEC Standard 100-A. Unless otherwise noted, in order to shorten the symbols, pin names and other related terminology have been abbreviated as follows:

| | |
|-----|---|
| | A23–A0 when the <u>physical-memory-width-bit</u> field of the $\overline{\text{STRBx}}$ control register is set to 32 bits |
| A | A23–A0 and $\overline{\text{STRBx_B3/A_1}}$ when the physical-memory-width-bit field of the $\overline{\text{STRBx}}$ control register is set to 16 bits |
| | A23–A0, $\overline{\text{STRBx_B3/A_1}}$, and $\overline{\text{STRBx_B2/A_2}}$ when the physical-memory-width-bit field of the $\overline{\text{STRBx}}$ control register is set to 8 bits |
| CI | CLKIN |
| RDY | $\overline{\text{RDY}}$ |
| D | D(31–0) |
| H | H1, H3 |
| IOS | $\overline{\text{IOSTRB}}$ |
| P | $t_{c(H)}$ |
| Q | $t_{c(Cl)}$ |
| RW | R/ \overline{W} |
| | $\overline{\text{STRBx_B(3–0)}}$ when the physical-memory-width-bit field of the $\overline{\text{STRBx}}$ control register is set to 32 bits |
| S | $\overline{\text{STRBx_B(1–0)}}$ when the physical-memory-width-bit field of the $\overline{\text{STRBx}}$ control register is set to 16 bits |
| | $\overline{\text{STRBx_B0}}$ when the physical-memory-width-bit field of the $\overline{\text{STRBx}}$ control register is set to 8 bits |
| XF | XF0 or XF1 |

operating characteristics for CLKIN, H1 and H3 [Q = $t_{c(CI)}$] (see Figure 14 and Figure 15)

| NO. | PARAMETERS | | TEST CONDITIONS | 'C32-40 | | 'C32-50 | | 'C32-60 | | UNIT |
|-----|--------------|-------------------------------------|-----------------|----------------|----------------|----------------|----------------|----------------|----------------|------|
| | | | | MIN | MAX | MIN | MAX | MIN | MAX | |
| 1 | $t_f(CI)$ | Fall time, CLKIN | | | 5 [‡] | | 5 [‡] | | 4 [‡] | ns |
| 2 | $t_w(CIL)$ | Pulse duration, CLKIN low | Q = MIN | 9 | | 7 | | 6 | | ns |
| 3 | $t_w(CIH)$ | Pulse duration, CLKIN high | Q = MIN | 9 [†] | | 8 [†] | | 6 [†] | | ns |
| 4 | $t_r(CI)$ | Rise time, CLKIN | | | 5 [‡] | | 5 [‡] | | 4 [‡] | ns |
| 5 | $t_c(CI)$ | Cycle time, CLKIN | | 25 | 303 | 20 | 303 | 16.67 | 303 | ns |
| 6 | $t_f(H)$ | Fall time, H1/H3 | | | 3 | | 3 | | 3 | ns |
| 7 | $t_w(HL)$ | Pulse duration, H1/H3 low | | Q-5 | | Q-5 | | Q-4 | | ns |
| 8 | $t_w(HH)$ | Pulse duration, H1/H3 high | | Q-6 | | Q-6 | | Q-5 | | ns |
| 9 | $t_r(H)$ | Rise time, H1/H3 | | | 3 | | 3 | | 3 | ns |
| 9.1 | $t_d(HL-HH)$ | Delay time, H1/H3 low to H1/H3 high | | 0 | 4 | 0 | 4 | 0 | 4 | ns |
| 10 | $t_c(H)$ | Cycle time, H1/H3 | | 50 | 606 | 40 | 606 | 33.33 | 606 | ns |

[†] The minimum CLKIN high pulse duration at 3.3 MHz is 10 ns.

TMS320C32 DIGITAL SIGNAL PROCESSOR

SPRS027C – JANUARY 1995 – REVISED DECEMBER 1996

timing for $\overline{\text{RESET}}$ [Q = $t_{c(CI)}$] (continued)

\dagger $\overline{\text{RESET}}$ is an asynchronous input and can be asserted at any point during a clock cycle. If the specified timings are met, the exact sequence shown occurs; otherwise, an additional delay of one clock cycle can occur.

\ddagger The R/ $\overline{\text{W}}$ output is placed in the high-impedance state during reset and can be provided with a resistive pullup, nominally 18–22 k Ω , if undesirable spurious writes can occur when these outputs go low.

\S In microprocessor mode (MCBL/ $\overline{\text{MP}}$ = 0), reset vector is fetched twice with seven software wait states each. In microcomputer mode (MCBL/ $\overline{\text{MP}}$ = 1), the reset vector is fetched two times, with no software wait states.

\ddagger Control signals include $\overline{\text{STRBx}}$ and $\overline{\text{IOSTRB}}$.

$\#$ Asynchronous reset signals include XF0/1, CLKX0, DX0, FSX0, CLKR0, DR0, FSR0, and TCLKx.

[†] Assured from characterization but not tested

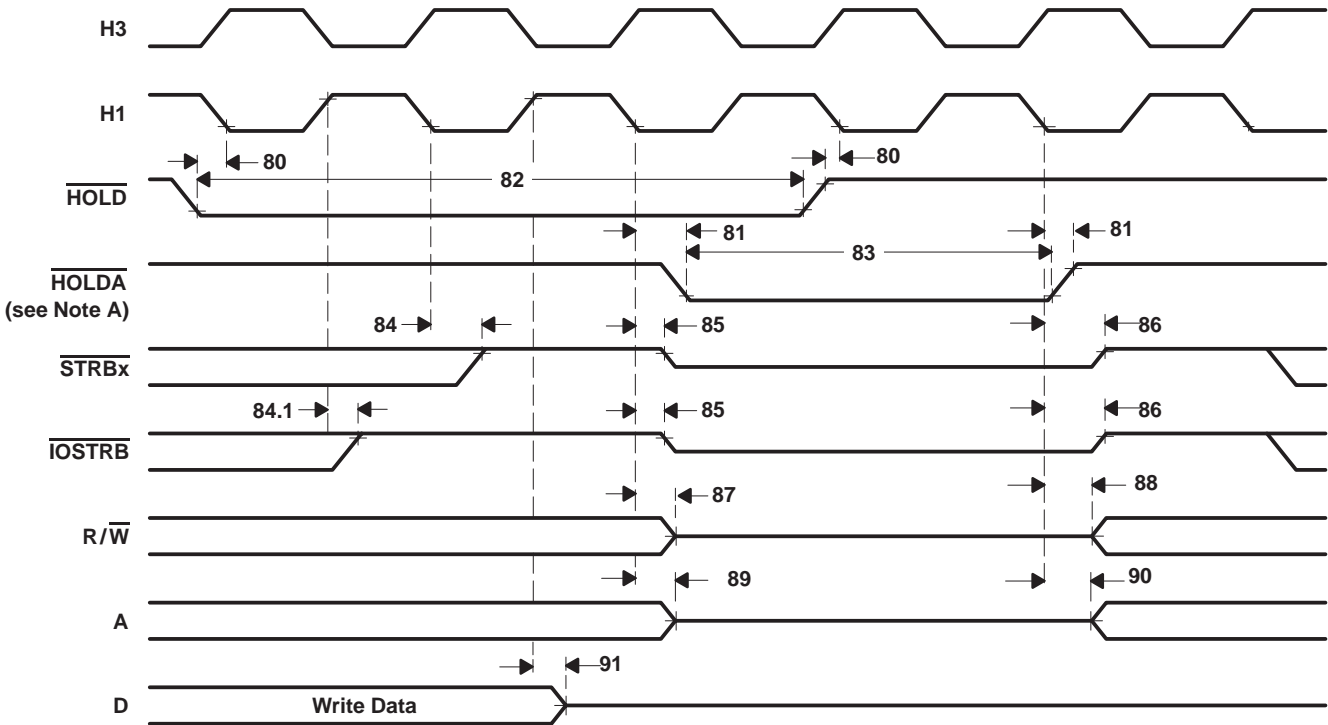

[‡] Not tested

NOTE 6: $\overline{\text{HOLD}}$ is an asynchronous input and can be asserted at any point during a clock cycle. If the specified timings are met, the exact sequence shown occurs; otherwise, an additional delay of one clock cycle can occur. The NOHOLD bit of the primary-bit-control register overwrites the $\overline{\text{HOLD}}$ signal.

TMS320C32
DIGITAL SIGNAL PROCESSOR

SPRS027C – JANUARY 1995 – REVISED DECEMBER 1996

timing for $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$ [$P = t_{c(H)}$] (see Note 6 and Figure 31) (continued)

NOTE A: $\overline{\text{HOLDA}}$ goes low in response to $\overline{\text{HOLD}}$ going low and continues to remain low until one H1 cycle after $\overline{\text{HOLD}}$ goes back high.

Figure 31. $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$ Timing

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Only one of markings shown within the brackets will appear on the physical device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
