#### **Features**

- High Performance, Low Power Atmel® AVR® 8-Bit Microcontroller
- Advanced RISC Architecture
  - 135 Powerful Instructions Most Single Clock Cycle Execution
  - 32 x 8 General Purpose Working Registers
  - Fully Static Operation
  - Up to 16 MIPS Throughput at 16MHz
  - On-Chip 2-cycle Multiplier
- High Endurance Non-volatile Memory Segments
  - 64K/128K/256KBytes of In-System Self-Programmable Flash
  - 4Kbytes EEPROM
  - 8Kbytes Internal SRAM
  - Write/Erase Cycles:10,000 Flash/100,000 EEPROM
  - Data retention: 20 years at 85°C/ 100 years at 25°C
  - Optional Boot Code Section with Independent Lock Bits
    - In-System Programming by On-chip Boot Program
    - True Read-While-Write Operation
  - Programming Lock for Software Security
    - Endurance: Up to 64Kbytes Optional External Memory Space
- Atmel<sup>®</sup> QTouch<sup>®</sup> library support
  - Capacitive touch buttons, sliders and wheels
  - QTouch and QMatrix® acquisition
  - Up to 64 sense channels
  - JTAG (IEEE std. 1149.1 compliant) Interface
    - Boundary-scan Capabilities According to the JTAG Standard
    - Extensive On-chip Debug Support
    - Programming of Flash, EEPROM, Fuses, and Lock Bits through the JTAG Interface
- Peripheral Features
  - Two 8-bit Timer/Counters with Separate Prescaler and Compare Mode
  - Four 16-bit Timer/Counter with Separate Prescaler, Compare- and Capture Mode
  - Real Time Counter with Separate Oscillator
  - Four 8-bit PWM Channels
  - Six/Twelve PWM Channels with Programmable Resolution from 2 to 16 Bits (ATmega1281/2561, ATmega640/1280/2560)
  - Output Compare Modulator
  - 8/16-channel, 10-bit ADC (ATmega1281/2561, ATmega640/1280/2560)
  - Two/Four Programmable Serial USART (ATmega1281/2561, ATmega640/1280/2560)
  - Master/Slave SPI Serial Interface
  - Byte Oriented 2-wire Serial Interface
  - Programmable Watchdog Timer with Separate On-chip Oscillator
  - On-chip Analog Comparator
  - Interrupt and Wake-up on Pin Change
- Special Microcontroller Features
  - Power-on Reset and Programmable Brown-out Detection
  - Internal Calibrated Oscillator
  - External and Internal Interrupt Sources
  - Six Sleep Modes: Idle, ADC Noise Reduction, Power-save, Power-down, Standby, and Extended Standby
- I/O and Packages
  - 54/86 Programmable I/O Lines (ATmega1281/2561, ATmega640/1280/2560)
  - 64-pad QFN/MLF, 64-lead TQFP (ATmega1281/2561)
  - 100-lead TQFP, 100-ball CBGA (ATmega640/1280/2560)
  - RoHS/Fully Green
- Temperature Range:
  - 40°C to 85°C Industrial
- Ultra-Low Power Consumption
  - Active Mode: 1MHz, 1.8V: 500μAPower-down Mode: 0.1μA at 1.8V
- Speed Grade:
  - ATmega640V/ATmega1280V/ATmega1281V:

Note: The large center pad underneath the QFN/MLF package is made of metal and internally connected to GND. It should be soldered or glued to the board to ensure good mechanical stability. If the center pad is left unconnected, the package might loosen from the board.

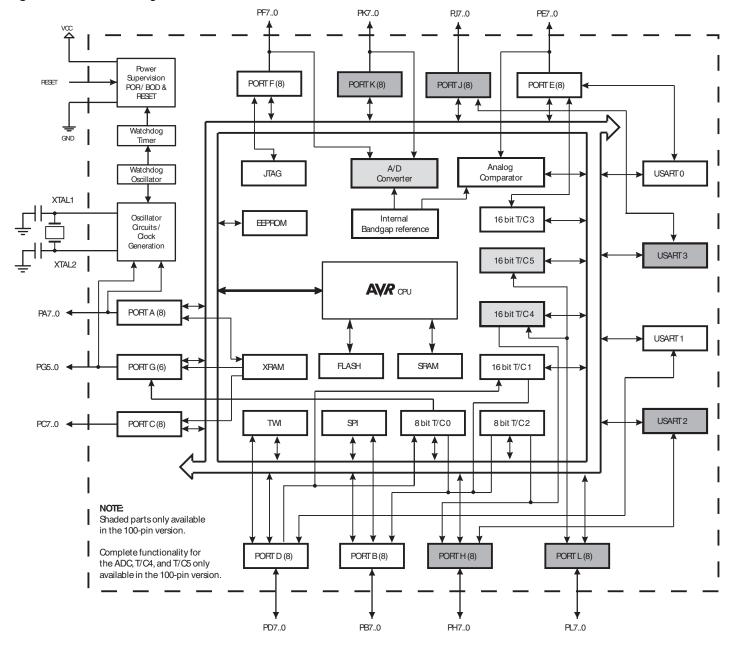

#### 2. Overview

The ATmega640/1281/2560/2561 is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATmega640/1280/1281/2560/2561 achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

### 2.1 Block Diagram

Figure 2-1. Block Diagram

The Atmel® AVR® core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The ATmega640/1280/1281/2560/2561 provides the following features: 64K/128K/256K bytes of In-System Programmable Flash with Read-While-Write capabilities, 4Kbytes EEPROM, 8 Kbytes SRAM, 54/86 general purpose I/O lines, 32 general purpose working registers, Real Time Counter (RTC), six flexible Timer/Counters with compare modes and PWM, 4 USARTs, a byte oriented 2-wire Serial Interface, a 16-channel, 10-bit ADC with optional differential input stage with programmable gain, programmable Watchdog Timer with Internal Oscillator, an SPI serial port, IEEE® std. 1149.1 compliant JTAG test interface, also used for accessing the Onchip Debug system and programming and six software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, SPI port, and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or Hardware Reset. In Powersave mode, the asynchronous timer continues to run, allowing the user to maintain a timer base while the rest of the device is sleeping. The ADC Noise Reduction mode stops the CPU and all I/O modules except Asynchronous Timer and ADC, to minimize switching noise during ADC conversions. In Standby mode, the Crystal/Resonator Oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low power consumption. In Extended Standby mode, both the main Oscillator and the Asynchronous Timer continue to run.

Atmel offers the QTouch<sup>®</sup> library for embedding capacitive touch buttons, sliders and wheels-functionality into AVR microcontrollers. The patented charge-transfer signal acquisition offersrobust sensing and includes fully debounced reporting of touch keys and includes Adjacent KeySuppression<sup>®</sup> (AKS<sup>™</sup>) technology for unambiguous detection of key events. The easy-to-use QTouch Suite toolchain allows you to explore, develop and debug your own touch applications.

The device is manufactured using Atmel's high-density nonvolatile memory technology. The Onchip ISP Flash allows the program memory to be reprogrammed in-system through an SPI serial interface, by a conventional nonvolatile memory programmer, or by an On-chip Boot program running on the AVR core. The boot program can use any interface to download the application program in the application Flash memory. Software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU with In-System Self-Programmable Flash on a monolithic chip, the Atmel ATmega640/1280/1281/2560/2561 is a powerful microcontroller that provides a highly flexible and cost effective solution to many embedded control applications.

The ATmega640/1280/1281/2560/2561 AVR is supported with a full suite of program and system development tools including: C compilers, macro assemblers, program debugger/simulators, in-circuit emulators, and evaluation kits.

### 2.2 Comparison Between ATmega1281/2561 and ATmega640/1280/2560

Each device in the ATmega640/1280/1281/2560/2561 family differs only in memory size and number of pins. Table 2-1 summarizes the different configurations for the six devices.

**Table 2-1.** Configuration Summary

## 2.3 Pin Descriptions

#### 2.3.1 VCC

Digital supply voltage.

#### 2.3.2 GND

Ground.

#### 2.3.3 Port A (PA7..PA0)

Port A is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port A pins that are externally pulled low will source current if the pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port A also serves the functions of various special features of the ATmega640/1280/1281/2560/2561 as listed on page 78.

#### 2.3.4 Port B (PB7..PB0)

Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B has better driving capabilities than the other ports.

Port B also serves the functions of various special features of the ATmega640/1280/1281/2560/2561 as listed on page 79.

#### 2.3.5 Port C (PC7..PC0)

Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up

resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port C also serves the functions of special features of the ATmega640/1280/1281/2560/2561 as listed on page 82.

#### 2.3.6 Port D (PD7..PD0)

Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port D also serves the functions of various special features of the ATmega640/1280/1281/2560/2561 as listed on page 83.

#### 2.3.7 Port E (PE7..PE0)

Port E is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port E output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port E pins that are externally pulled low will source current if the pull-up resistors are activated. The Port E pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port E also serves the functions of various special features of the ATmega640/1280/1281/2560/2561 as listed on page 86.

#### 2.3.8 Port F (PF7..PF0)

Port F serves as analog inputs to the A/D Converter.

Port F also serves as an 8-bit bi-directional I/O port, if the A/D Converter is not used. Port pins can provide internal pull-up resistors (selected for each bit). The Port F output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port F pins that are externally pulled low will source current if the pull-up resistors are activated. The Port F pins are tri-stated when a reset condition becomes active, even if the clock is not running. If the JTAG interface is enabled, the pull-up resistors on pins PF7(TDI), PF5(TMS), and PF4(TCK) will be activated even if a reset occurs.

Port F also serves the functions of the JTAG interface.

#### 2.3.9 Port G (PG5..PG0)

Port G is a 6-bit I/O port with internal pull-up resistors (selected for each bit). The Port G output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port G pins that are externally pulled low will source current if the pull-up resistors are activated. The Port G pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port G also serves the functions of various special features of the ATmega640/1280/1281/2560/2561 as listed on page 90.

#### 2.3.10 Port H (PH7..PH0)

Port H is a 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port H output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port H pins that are externally pulled low will source current if the pull-up

resistors are activated. The Port H pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port H also serves the functions of various special features of the ATmega640/1280/2560 as listed on page 92.

#### 2.3.11 Port J (PJ7..PJ0)

Port J is a 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port J output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port J pins that are externally pulled low will source current if the pull-up resistors are activated. The Port J pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port J also serves the functions of various special features of the ATmega640/1280/2560 as listed on page 94.

#### 2.3.12 Port K (PK7..PK0)

Port K serves as analog inputs to the A/D Converter.

Port K is a 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port K output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port K pins that are externally pulled low will source current if the pull-up resistors are activated. The Port K pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port K also serves the functions of various special features of the ATmega640/1280/2560 as listed on page 96.

#### 2.3.13 Port L (PL7..PL0)

Port L is a 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port L output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port L pins that are externally pulled low will source current if the pull-up resistors are activated. The Port L pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port L also serves the functions of various special features of the ATmega640/1280/2560 as listed on page 98.

#### 2.3.14 RESET

Reset input. A low level on this pin for longer than the minimum pulse length will generate a reset, even if the clock is not running. The minimum pulse length is given in "System and Reset Characteristics" on page 372. Shorter pulses are not guaranteed to generate a reset.

### 2.3.15 XTAL1

Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.

#### 2.3.16 XTAL2

Output from the inverting Oscillator amplifier.

#### 2.3.17 AVCC

AVCC is the supply voltage pin for Port F and the A/D Converter. It should be externally connected to  $V_{CC}$ , even if the ADC is not used. If the ADC is used, it should be connected to  $V_{CC}$  through a low-pass filter.

#### 2.3.18 AREF

This is the analog reference pin for the A/D Converter.

#### 3. Resources

A comprehensive set of development tools and application notes, and datasheets are available for download on <a href="http://www.atmel.com/avr">http://www.atmel.com/avr</a>.

## 4. About Code Examples

This documentation contains simple code examples that briefly show how to use various parts of the device. Be aware that not all C compiler vendors include bit definitions in the header files and interrupt handling in C is compiler dependent. Please confirm with the C compiler documentation for more details.

These code examples assume that the part specific header file is included before compilation. For I/O registers located in extended I/O map, "IN", "OUT", "SBIS", "SBIC", "CBI", and "SBI" instructions must be replaced with instructions that allow access to extended I/O. Typically "LDS" and "STS" combined with "SBRS", "SBRC", "SBR", and "CBR".

#### 5. Data Retention

Reliability Qualification results show that the projected data retention failure rate is much less than 1 ppm over 20 years at 85°C or 100 years at 25°C.

## Capacitive touch sensing

The Atmel®QTouch® Library provides a simple to use solution to realize touch sensitive interfaces on most Atmel AVR® microcontrollers. The QTouch Library includes support for the QTouch and QMatrix® acquisition methods.

Touch sensing can be added to any application by linking the appropriate Atmel QTouch Library for the AVR Microcontroller. This is done by using a simple set of APIs to define the touch channels and sensors, and then calling the touch sensing API's to retrieve the channel information and determine the touch sensor states.

The QTouch Library is FREE and downloadable from the Atmel website at the following location: www.atmel.com/qtouchlibrary. For implementation details and other information, refer to the Atmel QTouch Library User Guide - also available for download from the Atmel website.

Notes: 1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.

- 2. I/O registers within the address range \$00 \$1F are directly bit-accessible using the SBI and CBI instructions. In these registers, the value of single bits can be checked by using the SBIS and SBIC instructions.
- 3. Some of the status flags are cleared by writing a logical one to them. Note that the CBI and SBI instructions will operate on all bits in the I/O register, writing a one back into any flag read as set, thus clearing the flag. The CBI and SBI instructions work with registers 0x00 to 0x1F only.
- 4. When using the I/O specific commands IN and OUT, the I/O addresses \$00 \$3F must be used. When addressing I/O registers as data space using LD and ST instructions, \$20 must be added to these addresses. The ATmega640/1280/1281/2560/2561 is a complex microcontroller with more peripheral units than can be supported within the 64 location reserved in Opcode for the IN and OUT instructions. For the Extended I/O space from \$60 \$1FF in SRAM, only the ST/STS/STD and LD/LDS/LDD instructions can be used.

#### 10.4 64M2

#### 11. Errata

#### 11.1 ATmega640 rev. B

- Inaccurate ADC conversion in differential mode with 200x gain
- · High current consumption in sleep mode

#### 1. Inaccurate ADC conversion in differential mode with 200x gain

With AVCC <3.6V, random conversions will be inaccurate. Typical absolute accuracy may reach 64 LSB.

#### **Problem Fix/Workaround**

None.

#### 2. High current consumption in sleep mode

If a pending interrupt cannot wake the part up from the selected sleep mode, the current consumption will increase during sleep when executing the SLEEP instruction directly after a SEI instruction.

#### Problem Fix/Workaround

Before entering sleep, interrupts not used to wake the part from the sleep mode should be disabled.

- Inaccurate ADC conversion in differential mode with 200x gain
- High current consumption in sleep mode

#### 1. Inaccurate ADC conversion in differential mode with 200x gain

With AVCC <3.6V, random conversions will be inaccurate. Typical absolute accuracy may reach 64 LSB.

#### Problem Fix/Workaround

None.

#### 2. High current consumption in sleep mode

If a pending interrupt cannot wake the part up from the selected sleep mode, the current consumption will increase during sleep when executing the SLEEP instruction directly after a SEI instruction.

#### Problem Fix/Workaround

Before entering sleep, interrupts not used to wake the part from the sleep mode should be disabled.

- · Non-Read-While-Write area of flash not functional
- Part does not work under 2.4 volts
- Incorrect ADC reading in differential mode
- Internal ADC reference has too low value
- . IN/OUT instructions may be executed twice when Stack is in external RAM
- EEPROM read from application code does not work in Lock Bit Mode 3

#### 1. Non-Read-While-Write area of flash not functional

The Non-Read-While-Write area of the flash is not working as expected. The problem is related to the speed of the part when reading the flash of this area.

#### **Problem Fix/Workaround**

- Only use the first 248K of the flash.
- If boot functionality is needed, run the code in the Non-Read-While-Write area at maximum 1/4th of the maximum frequency of the device at any given voltage. This is done by writing the CLKPR register before entering the boot section of the code.

#### 2. Part does not work under 2.4 volts

The part does not execute code correctly below 2.4 volts.

#### Problem Fix/Workaround

Do not use the part at voltages below 2.4 volts.

#### 3. Incorrect ADC reading in differential mode

The ADC has high noise in differential mode. It can give up to 7 LSB error.

#### Problem Fix/Workaround

Use only the 7 MSB of the result when using the ADC in differential mode.

#### 4. Internal ADC reference has too low value

The internal ADC reference has a value lower than specified.

#### Problem Fix/Workaround

- Use AVCC or external reference.
- The actual value of the reference can be measured by applying a known voltage to the ADC when using the internal reference. The result when doing later conversions can then be calibrated.

#### 5. IN/OUT instructions may be executed twice when Stack is in external RAM

If either an IN or an OUT instruction is executed directly before an interrupt occurs and the stack pointer is located in external ram, the instruction will be executed twice. In some cases this will cause a problem, for example:

- If reading SREG it will appear that the I-flag is cleared.
- If writing to the PIN registers, the port will toggle twice.
- If reading registers with interrupt flags, the flags will appear to be cleared.

#### Problem Fix/Workaround

There are two application work-arounds, where selecting one of them, will be omitting the issue:

- Replace IN and OUT with LD/LDS/LDD and ST/STS/STD instructions.
- Use internal RAM for stack pointer.

#### 6. EEPROM read from application code does not work in Lock Bit Mode 3

When the Memory Lock Bits LB2 and LB1 are programmed to mode 3, EEPROM read does not work from the application code.

#### Problem Fix/Workaround

Do not set Lock Bit Protection Mode 3 when the application code needs to read from EEPROM.

## 12. Datasheet Revision History

Please note that the referring page numbers in this section are referring to this document. The referring revision in this section are referring to the document revision.

#### 12.1 Rev. 2549P-10/2012

- 1. Replaced drawing in 10.4 "64M2" on page 28.
- 2. Former page 439 has been deleted as the content of this page did not belong there (same page as the last page).
- 3. Some small correction made in the setup.

#### 12.2 Rev. 2549O-05/12

- The datasheet changed status from Preliminary to Complete. Removed "Preliminary" from the front page.
- 2. Replaced Figure 10-3 on page 46 by a new one.
- 3. Updated the last page to include the new address for Atmel Japan site.

#### 12.3 Rev. 2549N-05/11

- 1. Added Atmel QTouch Library Support and QTouch Sensing Capablity Features
- Updated Cross-reference in "Bit 5, 2:0 WDP3:0: Watchdog Timer Prescaler 3, 2, 1 and 0" on page 68
- 3. Updated Assembly codes in section "USART Initialization" on page 210
- 4. Added "Standard Power-On Reset" on page 372.
- 5. Added "Enhanced Power-On Reset" on page 373.
- 6. Updated Figure 32-13 on page 393
- 7. Updated "Ordering Information" on page 20 to include Tape & Reel devices.

#### 12.4 Rev. 2549M-09/10

- 1. Updated typos in Figure 26-9 on page 285 and in Figure 26-10 on page 285.
- 2. Note is added below Table 1-1 on page 3.
- 3. The values for "typical characteristics" in Table 31-9 on page 377 and Table 31-10 on page 378, has been rounded.
- 4. Units for tRST and tBOD in Table 31-3 on page 372 have been changed from "ns" to "μs".
- 5. The figure text for Table 31-2 on page 371 has been changed.
- 6. Text in first column in Table 30-3 on page 336 has been changed from "Fuse Low Byte" to "Extended Fuse Byte".
- 7. The text in "Power Reduction Register" on page 54 has been changed.
- 8. The value of the inductor in Figure 26-9 on page 285 and Figure 26-10 on page 285 has been changed to 10  $\mu$ H.
- 9. "Port A" has been changed into "Port K" in the first paragraph of "Features" on page 275.
- Minimum wait delay for tWD\_EEPROM in Table 30-16 on page 351 has been changed from 9.0ms to 3.6ms
- 11. Dimension A3 is added in "64M2" on page 28.
- Several cross-references are corrected.

- 13. "COM0A1:0" on page 130 is corrected to "COM0B1:0".
- Corrected some Figure and Table numbering.
- 15. Updated Section 10.6 "Low Frequency Crystal Oscillator" on page 45.

#### 12.5 Rev. 2549L-08/07

- 1. Updated note in Table 10-11 on page 47.
- 2. Updated Table 10-3 on page 43, Table 10-5 on page 44, Table 10-9 on page 47.
- 3. Updated typos in "DC Characteristics" on page 367
- 4. Updated "Clock Characteristics" on page 371
- 5. Updated "External Clock Drive" on page 371.
- 6. Added "System and Reset Characteristics" on page 372.
- 7. Updated "SPI Timing Characteristics" on page 375.
- 8. Updated "ADC Characteristics Preliminary Data" on page 377.
- 9. Updated ordering code in "ATmega640" on page 20.

#### 12.6 Rev. 2549K-01/07

- 1. Updated Table 1-1 on page 3.
- 2. Updated "Pin Descriptions" on page 7.
- 3. Updated "Stack Pointer" on page 16.
- 4. Updated "Bit 1 EEPE: EEPROM Programming Enable" on page 36.
- 5. Updated Assembly code example in "Thus, when the BOD is not enabled, after setting the ACBG bit or enabling the ADC, the user must always allow the reference to start up before the output from the Analog Comparator or ADC is used. To reduce power consumption in Power-down mode, the user can avoid the three conditions above to ensure that the reference is turned off before entering Power-down mode." on page 63.
- 6: Updated "EIMSK External Interrupt Mask Register" on page 115.
- 7. Updated Bit description in "PCIFR Pin Change Interrupt Flag Register" on page 116.
- 8. Updated code example in "USART Initialization" on page 210.
- 9. Updated Figure 26-8 on page 284.
- 10. Updated "DC Characteristics" on page 367.

#### 12.7 Rev. 2549J-09/06

- 1. Updated "" on page 46.
- Updated code example in "Moving Interrupts Between Application and Boot Section" on page 109.
- 3. Updated "Timer/Counter Prescaler" on page 186.
- 4. Updated "Device Identification Register" on page 303.
- Updated "Signature Bytes" on page 338.
- 6. Updated "Instruction Set Summary" on page 17.

#### 12.8 Rev. 2549I-07/06

- 1. Added "Data Retention" on page 11.
- Updated Table 16-3 on page 129, Table 16-6 on page 130, Table 16-8 on page 131, Table 17-2 on page 148, Table 17-4 on page 159, Table 17-5 on page 160, Table 20-3 on page 187, Table 20-6 on page 188 and Table 20-8 on page 189.
- 3. Updated "Fast PWM Mode" on page 150.

#### 12.9 Rev. 2549H-06/06

- 1. Updated "" on page 46.
- Updated "OSCCAL Oscillator Calibration Register" on page 50.
- 3. Added Table 31-1 on page 371.

#### 12.10 Rev. 2549G-06/06

- 1. Updated "Features" on page 1.
- 2. Added Figure 1-2 on page 3, Table 1-1 on page 3.
- 3. Updated "" on page 46.
- 4. Updated "Power Management and Sleep Modes" on page 52.
- 5. Updated note for Table 12-1 on page 68.
- 6. Updated Figure 26-9 on page 285 and Figure 26-10 on page 285.
- 7. Updated "Setting the Boot Loader Lock Bits by SPM" on page 324.
- 8. Updated "Ordering Information" on page 20.
- 9. Added Package information "100C1" on page 26.
- 10. Updated "Errata" on page 29.

#### 12.11 Rev. 2549F-04/06

- 1. Updated Figure 9-3 on page 31, Figure 9-4 on page 31 and Figure 9-5 on page 32.
- 2. Updated Table 20-2 on page 187 and Table 20-3 on page 187.
- 3. Updated Features in "ADC Analog to Digital Converter" on page 275.
- 4. Updated "Fuse Bits" on page 336.

#### 12.12 Rev. 2549E-04/06

- 1. Updated "Features" on page 1.
- 2. Updated Table 12-1 on page 62.
- 3. Updated note for Table 12-1 on page 62.
- 4. Updated "Bit 6 ACBG: Analog Comparator Bandgap Select" on page 273.
- 5. Updated "Prescaling and Conversion Timing" on page 278.
- 5. Updated "Maximum speed vs. V<sub>CC</sub>" on page 373.
- 6. Updated "Ordering Information" on page 20.

#### 12.13 Rev. 2549D-12/05

- 1. Advanced Information Status changed to Preliminary.
- 2. Changed number of I/O Ports from 51 to 54.
- 3. Updatet typos in "TCCR0A Timer/Counter Control Register A" on page 129.
- 4. Updated Features in "ADC Analog to Digital Converter" on page 275.
- 5. Updated Operation in "ADC Analog to Digital Converter" on page 275
- 6. Updated Stabilizing Time in "Changing Channel or Reference Selection" on page 282.
- 7. Updated Figure 26-1 on page 276, Figure 26-9 on page 285, Figure 26-10 on page 285.
- 8. Updated Text in "ADCSRB ADC Control and Status Register B" on page 290.
- 9. Updated Note for Table 4 on page 43, Table 13-15 on page 86, Table 26-3 on page 289 and Table 26-6 on page 295.
- 10. Updated Table 31-9 on page 377 and Table 31-10 on page 378.
- 11. Updated "Filling the Temporary Buffer (Page Loading)" on page 323.
- 12. Updated "Typical Characteristics" on page 385.
- 13. Updated "Packaging Information" on page 25.
- 14. Updated "Errata" on page 29.

#### 12.14 Rev. 2549C-09/05

- 1. Updated Speed Grade in section "Features" on page 1.
- 2. Added "Resources" on page 11.
- 3. Updated "SPI Serial Peripheral Interface" on page 195. In Slave mode, low and high period SPI clock must be larger than 2 CPU cycles.
- 4. Updated "Bit Rate Generator Unit" on page 247.
- 5. Updated "Maximum speed vs. V<sub>CC</sub>" on page 373.
- 6. Updated "Ordering Information" on page 20.
- 7. Updated "Packaging Information" on page 25. Package 64M1 replaced by 64M2.
- 8. Updated "Errata" on page 29.

#### 12.15 Rev. 2549B-05/05

- 1. JTAG ID/Signature for ATmega640 updated: 0x9608.
- 2. Updated Table 13-7 on page 81.
- 3. Updated "Serial Programming Instruction set" on page 352.
- 4. Updated "Errata" on page 29.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

#### Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов:
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001:
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
