Introduction

The evaluation board is designed for customers to easily work with “WYSACVLXY-XX”, *MCU embedded Wireless LAN* module, for functional evaluation purpose. This document describes the hardware configuration and the usage.

Target module

WYSACVLXY-XX

Accessories

1	Evaluation Board (WBSACVLXY-1)	1 piece
---	--------------------------------	---------

Recommended operating environment

HOST PC:

CPU: 1000MHz or higher

Interface: USB

DC Power Supply: (External power supply is not required.)

Supplying Voltage = 4.5V to 5.5V

Current limit should be set 1A.

Block diagram

WBSACVLXY-1 has several connectors. J4 (USB mini B connector) is used for USB signal that is converted from UART by FT232RQ. The embedded application running on WBSACVLXY uses UART as a host interface usually. Solder bridge port (SB1-4) are used to switch UART interfaces (U9 or J2). J1 and J6 are jumper connector to switch power sources (from LDO or from J2/J3).

Example of connection for evaluation

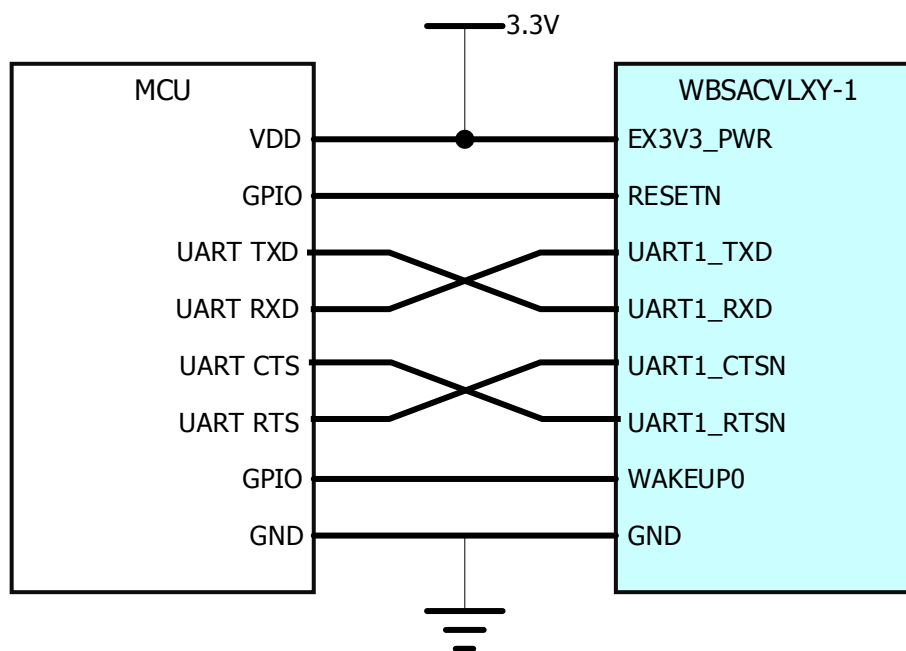

Case1. With PC

- Put jumper on J1 and J6 and connect USB cable
- Connect USB cable between PC and WBSACLVXY-1
- Run serial terminal software. Default baud rate of the module is 115.2kbps. Please configure baud rate of serial terminal software.

Case2. Using external interface (with other MCU)

- Cut the line between the land patterns of Solder Bridge SB1 – SB4 in order to disconnect the UART line of the module from FT232RQ.
- Put jumper on J6 only and supply power source (3.3V) to J2/J3 pin#1.
- **DO NOT** put jumper on J1 in this case. If do that, MCU and WBSACVLXY-1 may be broken.
