MAX5492

General Description

The MAX5492 precision resistor-divider consists of two accurately matched resistors with access to the ends and center of the divider. This device offers excellent resistance matching of 0.035% (A grade), 0.05% (B grade), and 0.1% (C grade). The MAX5492 includes an extremely low-resistance-ratio temperature drift of 1.5ppm/ $^{\circ}$ C (typ) over -55° C to $+125^{\circ}$ C, and has an end-to-end resistance of 10k Ω . Resistance ratios from 1:1 to 10:1 are available. Five standard ratios are available (see Table 1), and custom ratios are also available upon request. To enhance device and system robustness, the MAX5492 features ± 2 kV Human Body Model electrostatic discharge (ESD) protection to ensure against real-world ESD events. Pin Description

PIN	NAME	FUNCTION
1	P1	R1 Connection Terminal
2	SL	Sense Connection for Low Side of Resistor String. Leave floating or connect in a Kelvin connection configuration.
3	P2	R2 Connection Terminal
4	P3	Set-Point Connection Terminal

Detailed Description

The MAX5492 consists of two precision, low-ratio-drift resistors with an end-to-end resistance of 10kΩ (R₁ + R₂). (See Figure 1.) P3 is the set point of the divider. The maximum working voltage of the MAX5492 is 40V. This device offers a wide range of resistance ratios (R₁/R₂) from 1:1 to 10:1 and is ideally suited for precision operational-amplifier gain/attenuation control. The MAX5492 features a ±2kV ESD protection that enhances system robustness. A maximum initial ratio accuracy of 0.035% and a low ratio drift enhance system accuracy.

Applications Information

Kelvin Sensing

Kelvin sensing can improve accuracy in sensitive applications. Apply a voltage or current at P1 and use sense high (SH) and sense low (SL) to monitor the voltage at the upper and lower ends of the resistor string.

Self-Heating and Error

Applying a voltage across terminals P1 and P2 causes the device to heat up due to power dissipation. In high-voltage applications, consider the error in resistance-ratio temperature coefficient caused by self-heating. The worst-case self-heating occurs when the operating voltage attains its maximum value. Approximate the result of power dissipation under this condition as:

$$P_{DISS} = \frac{(V_{MAX})^2}{R} = \frac{(40V)^2}{10k\Omega} = 160mW$$

The thermal resistance from junction to ambient, θ_{JA} , for a 5-pin SOT23 package is 141°C/W. Calculate the resulting temperature rise as:

$$\Delta T = 160mW \times 141^\circ C/W = 22.5^\circ C$$

If the ratio temperature coefficient is 1.5ppm/°C (typ), the total error introduced by self-heating is:

$$22.5^\circ C \times 1.5ppm/^\circ C = 33.75ppm$$
