bq4285

UNITRODE

Real-Time Clock (RTC) With NVRAM Control

Features

➤ Direct clock/calendar replacement for IBM® AT-compatible computers and other applications

➤ Functionally compatible with the DS1285

- Closely matches MC146818A pin configuration

➤ 114 bytes of general nonvolatile storage

➤ Automatic backup and write-protect control to external SRAM

➤ 160 ns cycle time allows fast bus operation

➤ Less than 0.5 µA load under battery operation

➤ 14 bytes for clock/calendar and control

➤ Calendar in day of the week, day of the month, months, and years, with automatic leap-year adjustment

➤ Time of day in seconds, minutes, and hours

- 12- or 24-hour format

- Optional daylight saving adjustment

➤ BCD or binary format for clock and calendar data

➤ Programmable square wave output

➤ Three individually maskable interrupt event flags:

- Periodic rates from 122 µs to 500 ms

- Time-of-day alarm once per second to once per day

- End-of-clock update cycle

➤ 24-pin plastic DIP or SOIC

General Description

The CMOS bq4285 is a low-power microprocessor peripheral providing a time-of-day clock and 100-year calendar with alarm features and battery operation. Other features include three maskable interrupt sources, square wave output, and 114 bytes of general nonvolatile storage.

The bq4285 write-protects the clock, calendar, and storage registers during power failure. A backup battery then maintains data and operates the clock and calendar.

The bq4285 is a fully compatible real-time clock for IBM AT-compatible computers and other applications. The only external components are a 32.768kHz crystal and a backup battery.

The bq4285 integrates a battery-backup controller to make a standard CMOS SRAM nonvolatile during power-fail conditions. During power-fail, the bq4285 automatically write-protects the external SRAM and provides a V_{CC} output sourced from the clock backup battery.

Pin Connections

Block Diagram
Pin Descriptions

AD$_0$–AD$_7$ **Multiplexed address/data input/ output**

The bq4285 bus cycle consists of two phases: the address phase and the data-transfer phase. The address phase precedes the data-transfer phase. During the address phase, an address placed on AD$_0$–AD$_7$ is latched into the bq4285 on the falling edge of the AS signal. During the data-transfer phase of the bus cycle, the AD$_0$–AD$_7$ pins serve as a bidirectional data bus.

MOT **Connect to VSS for correct operation**

$\overline{CS}$ **Chip select input**

$\overline{CS}$ should be driven low and held stable during the data-transfer phase of a bus cycle accessing the bq4285.

Table 1. Bus Setup

Bus Type	MOT Level	DS Equivalent	R/$\overline{W}$ Equivalent	AS Equivalent
			—	
Intel	V$_{SS}$	$\overline{RD}$, $\overline{MEMR}$, or $\overline{I/OR}$	$\overline{WR}$, $\overline{MEMW}$, or $\overline{I/OW}$	ALE

AS **Address strobe input**

AS serves to demultiplex the address/data bus. The falling edge of AS latches the address on AD_0–AD_7. This demultiplexing process is independent of the $\overline{CS}$ signal.

DS **Data strobe input**

With MOT = V_{SS}, the DS input is provided a signal similar to $\overline{RD}$, $\overline{MEMR}$, or $\overline{I/OR}$ in an Intel-based system. The falling edge on DS is used to enable the outputs during a read cycle.

R/$\overline{W}$ **Read/write input**

With MOT = V_{SS}, R/$\overline{W}$ is provided a signal similar to $\overline{WR}$, $\overline{MEMW}$, or $\overline{I/OW}$ in an Intel-based system. The rising edge on R/$\overline{W}$ latches data into the bq4285.

—

—

$\overline{INT}$ **Interrupt request output**

$\overline{INT}$ is an open-drain output. $\overline{INT}$ is asserted low when any event flag is set and the corresponding event enable bit is also set. $\overline{INT}$ becomes high-impedance whenever register C is read (see the Control/Status Registers section).

$\overline{RST}$ **Reset input**

The bq4285 is reset when $\overline{RST}$ is pulled low. When reset, $\overline{INT}$ becomes high-impedance, and the bq4285 is not accessible. Table 4 in the Control/Status Registers section lists the register bits that are cleared by a reset.

Reset may be disabled by connecting $\overline{RST}$ to V_{CC}. This allows the control bits to retain their states through power-down/power-up cycles.

SQW **Square-wave output**

SQW may output a programmable frequency square-wave signal during normal (V_{CC} valid) system operation. Any one of the 13 specific frequencies may be selected through register A. This pin is held low when the square-wave enable bit (SQWE) in register B is 0 (see the Control/Status Registers section).

BC **3V backup cell input**

BC should be connected to a 3V backup cell for RTC operation and storage register non-volatility in the absence of power. When V_{CC} slews down past V_{BC} (3V typical), the integral control circuitry switches the power source to BC. When V_{CC} returns above V_{BC}, the power source is switched to V_{CC}.

Upon power-up, a voltage within the V_{BC} range must be present on the BC pin for the oscillator to start up.

X1–X2 **Crystal inputs**

The X1–X2 inputs are provided for an external 32.768Khz quartz crystal, Daiwa DT-26 or equivalent, with 6pF load capacitance. A trimming capacitor may be necessary for extremely precise time-base generation.

$\overline{CE}_{IN}$ **External RAM chip enable input, active low**

$\overline{CE}_{IN}$ should be driven low to enable the controlled external RAM. $\overline{CE}_{IN}$ is internally pulled up with a 50KΩ resistor.

$\overline{CE}_{OUT}$ **External RAM chip enable output, active low**

When power is valid, $\overline{CE}_{OUT}$ reflects $\overline{CE}_{IN}$.

V_{OUT} **Supply output**

V_{OUT} provides the higher of V_{CC} or V_{BC}, switched internally, to supply external RAM.

V_{CC} **+5V supply**

V_{SS} **Ground**

Functional Description

Address Map

The bq4285 provides 14 bytes of clock and control/status registers and 114 bytes of general nonvolatile storage. Figure 1 illustrates the address map for the bq4285.

Update Period

The update period for the bq4285 is one second. The bq4285 updates the contents of the clock and calendar locations during the update cycle at the end of each up-date period (see Figure 2). The alarm flag bit may also be set during the update cycle.

The bq4285 copies the local register updates into the user buffer accessed by the host processor. When a 1 is written to the update transfer inhibit bit (UTI) in register B, the user copy of the clock and calendar bytes remains unchanged, while the local copy of the same bytes continues to be updated every second.

The update-in-progress bit (UIP) in register A is set t_{BUC} time before the beginning of an update cycle (see Figure 2). This bit is cleared and the update-complete flag (UF) is set at the end of the update cycle.

Figure 1. Address Map

Figure 2. Update Period Timing and UIP

Programming the RTC

The time-of-day, alarm, and calendar bytes can be written in either the BCD or binary format (see Table 2).

These steps may be followed to program the time, alarm, and calendar:

1. Modify the contents of register B:

    a. Write a 1 to the UTI bit to prevent transfers between RTC bytes and user buffer.

    b. Write the appropriate value to the data format (DF) bit to select BCD or binary format for all time, alarm, and calendar bytes.

    c. Write the appropriate value to the hour format (HF) bit.

2. Write new values to all the time, alarm, and calendar locations.

3. Clear the UTI bit to allow update transfers.

On the next update cycle, the RTC updates all 10 bytes in the selected format.

Table 2. Time, Alarm, and Calendar Formats

Address	RTC Bytes	Range		
		Decimal	Binary	Binary-Coded Decimal
0	Seconds	0–59	00H–3BH	00H–59H
1	Seconds alarm	0–59	00H–3BH	00H–59H
2	Minutes	0–59	00H–3BH	00H–59H
3	Minutes alarm	0–59	00H–3BH	00H–59H
4	Hours, 12-hour format	1–12	01H–OCH AM; 81H–8CH PM	01H–12H AM; 81H–92H PM
	Hours, 24-hour format	0–23	00H–17H	00H–23H
5	Hours alarm, 12-hour format	1–12	01H–OCH AM; 81H–8CH PM	01H–12H AM; 81H–92H PM
	Hours alarm, 24-hour format	0–23	00H–17H	00H–23H
6	Day of week (1=Sunday)	1–7	01H–07H	01H–07H
7	Day of month	1–31	01H–1FH	01H–31H
8	Month	1–12	01H–0CH	01H–12H
9	Year	0–99	00H–63H	00H–99H

Square-Wave Output

The bq4285 divides the 32.768kHz oscillator frequency to produce the 1 Hz update frequency for the clock and calendar. Thirteen taps from the frequency divider are fed to a 16:1 multiplexer circuit. The output of this mux is fed to the SQW output and periodic interrupt generation circuitry. The four least-significant bits of register A, RS0–RS3, select among the 13 taps (see Table 3). The square-wave output is enabled by writing a 1 to the square-wave enable bit (SQWE) in register B.

Interrupts

The bq4285 allows three individually selected interrupt events to generate an interrupt request. These three interrupt events are:

- The periodic interrupt, programmable to occur once every 122 μs to 500 ms

- The alarm interrupt, programmable to occur once per second to once per day

- The update-ended interrupt, which occurs at the end of each update cycle

Each of the three interrupt events is enabled by an individual interrupt-enable bit in register B. When an event occurs, its event flag bit in register C is set. If the corresponding event enable bit is also set, then an interrupt request is generated. The interrupt request flag bit (INTF) of register C is set with every interrupt request. Reading register C clears all flag bits, including INTF, and makes INT high-impedance.

Two methods can be used to process bq4285 interrupt events:

- Enable interrupt events and use the interrupt request output to invoke an interrupt service routine.

- Do not enable the interrupts and use a polling routine to periodically check the status of the flag bits.

The individual interrupt sources are described in detail in the following sections.

Table 3. Square-Wave Frequency/Periodic Interrupt Rate

Register A Bits				Square Wave		Periodic Interrupt	
RS3	RS2	RS1	RS0	Frequency	Units	Period	Units
0	0	0	0	None		None	
0	0	0	1	256	Hz	3.90625	ms
0	0	1	0	128	Hz	7.8125	ms
0	0	1	1	8.192	kHz	122.070	μs
0	1	0	0	4.096	kHz	244.141	μs
0	1	0	1	2.048	kHz	488.281	μs
0	1	1	0	1.024	kHz	976.5625	μs
0	1	1	1	512	Hz	1.95315	ms
1	0	0	0	256	Hz	3.90625	ms
1	0	0	1	128	Hz	7.8125	ms
1	0	1	0	64	Hz	15.625	ms
1	0	1	1	32	Hz	31.25	ms
1	1	0	0	16	Hz	62.5	ms
1	1	0	1	8	Hz	125	ms
1	1	1	0	4	Hz	250	ms
1	1	1	1	2	Hz	500	ms

Periodic Interrupt

The mux output used to drive the SQW output also drives the interrupt-generation circuitry. If the periodic interrupt event is enabled by writing a 1 to the periodic interrupt enable bit (PIE) in register C, an interrupt request is generated once every 122μs to 500ms. The period between interrupts is selected by the same bits in register A that select the square wave frequency (see Table 3).

Alarm Interrupt

During each update cycle, the RTC compares the hours, minutes, and seconds bytes with the three corresponding alarm bytes. If a match of all bytes is found, the alarm interrupt event flag bit, AF in register C, is set to 1. If the alarm event is enabled, an interrupt request is generated.

An alarm byte may be removed from the comparison by setting it to a "don't care" state. An alarm byte is set to a "don't care" state by writing a 1 to each of its two most-significant bits. A "don't care" state may be used to select the frequency of alarm interrupt events as follows:

- If none of the three alarm bytes is "don't care," the frequency is once per day, when hours, minutes, and seconds match.

- If only the hour alarm byte is "don't care," the frequency is once per hour, when minutes and seconds match.

- If only the hour and minute alarm bytes are "don't care," the frequency is once per minute, when seconds match.

- If the hour, minute, and second alarm bytes are "don't care," the frequency is once per second.

Update Cycle Interrupt

The update cycle ended flag bit (UF) in register C is set to a 1 at the end of an update cycle. If the update interrupt enable bit (UIE) of register B is 1, and the update transfer inhibit bit (UTI) in register B is 0, then an interrupt request is generated at the end of each update cycle.

Accessing RTC bytes

Time and calendar bytes read during an update cycle may be in error. Three methods to access the time and calendar bytes without ambiguity are:

- Enable the update interrupt event to generate interrupt requests at the end of the update cycle. The interrupt handler has a maximum of 999ms to access the clock bytes before the next update cycle begins (see Figure 3).

- Poll the update-in-progress bit (UIP) in register A. If UIP = 0, the polling routine has a minimum of t_{BUC} time to access the clock bytes (see Figure 3).

- Use the periodic interrupt event to generate interrupt requests every t_{PI} time, such that UIP = 1 always occurs between the periodic interrupts. The interrupt handler will have a minimum of $t_{PI}/2 + t_{BUC}$ time to access the clock bytes (see Figure 3).

Oscillator Control

When power is first applied to the bq4285 and V_{CC} is above V_{PFD}, the internal oscillator and frequency divider are turned on by writing a 010 pattern to bits 4 through 6 of register A. A pattern of 11X turns the oscillator on but keeps the frequency divider disabled. Any other pattern to these bits keeps the oscillator off.

Figure 3. Update-Ended/Periodic Interrupt Relationship

Power-Down/Power-Up Cycle

The bq4285 continuously monitors V_{CC} for out-of-tolerance. During a power failure, when V_{CC} falls below V_{PFD} (4.17V typical), the bq4285 write-protects the clock and storage registers. When V_{CC} is below V_{BC} (3V typical), the power source is switched to BC. RTC operation and storage data are sustained by a valid backup energy source. When V_{CC} is above V_{BC}, the power source is V_{CC}. Write-protection continues for t_{CSR} time after V_{CC} rises above V_{PFD}.

An external CMOS static RAM is battery-backed using the V_{OUT} and chip enable output pins from the bq4285. As the voltage input V_{CC} slows down during a power failure, the chip enable output, $\overline{CE}_{OUT}$, is forced inactive independent of the chip enable input $\overline{CE}_{IN}$.

This activity unconditionally write-protects the external SRAM as V_{CC} falls below V_{PFD}. If a memory access is in process to the external SRAM during power-fail detection, that memory cycle continues to completion before the memory is write-protected. If the memory cycle is not terminated within time t_{WPT} (30µs maximum), the chip enable output is unconditionally driven high, write-protecting the controlled SRAM.

As the supply continues to fall past V_{PFD}, an internal switching device forces V_{OUT} to the external backup energy source. $\overline{CE}_{OUT}$ is held high by the V_{OUT} energy source.

During power-up, V_{OUT} is switched back to the 5V supply as V_{CC} rises above the backup cell input voltage sourcing V_{OUT}. $\overline{CE}_{OUT}$ is held inactive for time t_{CER} (200ms maximum) after the power supply has reached V_{PFD}, independent of the $\overline{CE}_{IN}$ input, to allow for processor stabilization.

During power-valid operation, the $\overline{CE}_{IN}$ input is passed through to the $\overline{CE}_{OUT}$ output with a propagation delay of less than 10ns.

Figure 4 shows the hardware hookup for the external RAM.

A primary backup energy source input is provided on the bq4285. The BC input accepts a 3V primary battery, typically some type of lithium chemistry. To prevent battery drain when there is no valid data to retain, V_{OUT} and $\overline{CE}_{OUT}$ are internally isolated from BC by the initial connection of a battery. Following the first application of V_{CC} above V_{PFD}, this isolation is broken, and the backup cell provides power to V_{OUT} and $\overline{CE}_{OUT}$ for the external SRAM.

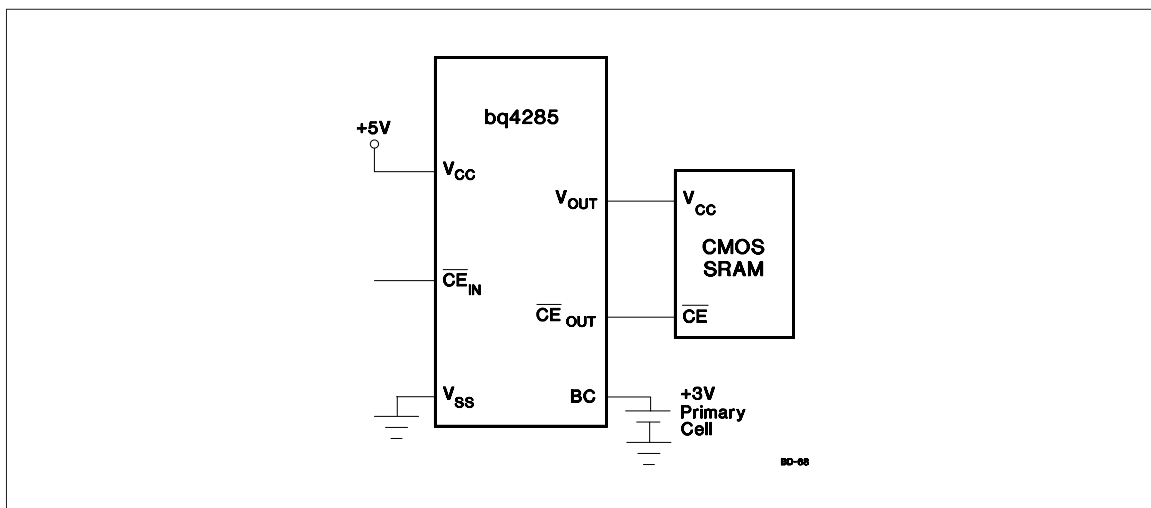

Figure 4. External RAM Hookup to the bq4285 RTC

Control/Status Registers

The four control/status registers of the bq4285 are accessible regardless of the status of the update cycle (see Table 4).

Register A

Register A Bits							
7	6	5	4	3	2	1	0
UIP	OS2	OS1	OS0	RS3	RS2	RS1	RS0

Register A programs:

- The frequency of the square-wave and the periodic event rate.

- Oscillator operation.

Register A provides:

- Status of the update cycle.

RS0–RS3 - Frequency Select

7	6	5	4	3	2	1	0
-	-	-	-	RS3	RS2	RS1	RS0

These bits select one of the 13 frequencies for the SQW output and the periodic interrupt rate, as shown in Table 3.

OS0–OS2 - Oscillator Control

7	6	5	4	3	2	1	0
-	OS2	OS1	OS0	-	-	-	-

These three bits control the state of the oscillator and divider stages. A pattern of 010 enables RTC operation by turning on the oscillator and enabling the frequency divider. A pattern of 11X turns the oscillator on, but keeps the frequency divider disabled. When 010 is written, the RTC begins its first update after 500ms.

UIP - Update Cycle Status

7	6	5	4	3	2	1	0
UIP	-	-	-	-	-	-	-

This read-only bit is set prior to the update cycle. When UIP equals 1, an RTC update cycle may be in progress. UIP is cleared at the end of each update cycle. This bit is also cleared when the update transfer inhibit (UTI) bit in register B is 1.

Register B

Register B Bits							
7	6	5	4	3	2	1	0
UTI	PIE	AIE	UIE	SQWE	DF	HF	DSE

Register B enables:

- Update cycle transfer operation

- Square-wave output

- Interrupt events

- Daylight saving adjustment

Register B selects:

- Clock and calendar data formats

All bits of register B are read/write.

Table 4. Control/Status Registers

Reg.	Loc. (Hex)	Read	Write	Bit Name and State on Reset															
				7 (MSB)		6		5		4		3		2		1		0 (LSB)	
A	0A	Yes	Yes[1]	UIP	na	OS2	na	OS1	na	OS0	na	RS3	na	RS2	na	RS1	na	RS0	na
B	0B	Yes	Yes	UTI	na	PIE	0	AIE	0	UIE	0	SQWE	0	DF	na	HF	na	DSE	na
C	0C	Yes	No	INTF	0	PF	0	AF	0	UF	0	-	0	-	0	-	0	-	0

Notes: na = not affected.
1. Except bit 7.

bq4285

DSE - Daylight Saving Enable

7	6	5	4	3	2	1	0
-	-	-	-	-	-	-	DSE

This bit enables daylight-saving time adjustments when written to 1:

- On the last Sunday in October, the first time the bq4285 increments past 1:59:59 AM, the time falls back to 1:00:00 AM.

- On the first Sunday in April, the time springs forward from 2:00:00 AM to 3:00:00 AM.

HF - Hour Format

7	6	5	4	3	2	1	0
-	-	-	-	-	-	HF	-

This bit selects the time-of-day and alarm hour format:

    1 = 24-hour format

    0 = 12-hour format

DF - Data Format

7	6	5	4	3	2	1	0
-	-	-	-	-	DF	-	-

This bit selects the numeric format in which the time, alarm, and calendar bytes are represented:

    1 = Binary

    0 = BCD

SQWE - Square-Wave Enable

7	6	5	4	3	2	1	0
-	-	-	-	SQWE	-	-	-

This bit enables the square-wave output:

    1 = Enabled

    0 = Disabled and held low

UIE - Update Cycle Interrupt Enable

7	6	5	4	3	2	1	0
-	-	-	UIE	-	-	-	-

This bit enables an interrupt request due to an update ended interrupt event:

    1 = Enabled

    0 = Disabled

The UIE bit is automatically cleared when the UTI bit equals 1.

AIE - Alarm Interrupt Enable

7	6	5	4	3	2	1	0
-	-	AIE	-	-	-	-	-

This bit enables an interrupt request due to an alarm interrupt event:

    1 = Enabled

    0 = Disabled

PIE - Periodic Interrupt Enable

7	6	5	4	3	2	1	0
-	PIE	-	-	-	-	-	-

This bit enables an interrupt request due to a periodic interrupt event:

    1 = Enabled

    0 = Disabled

UTI - Update Transfer Inhibit

7	6	5	4	3	2	1	0
UTI	-	-	-	-	-	-	-

This bit inhibits the transfer of RTC bytes to the user buffer:

    1 = Inhibits transfer and clears UIE

    0 = Allows transfer

Register C

Register C Bits							
7	6	5	4	3	2	1	0
INTF	PF	AF	UF	0	0	0	0

Register C is the read-only event status register.

Bits 0–3 - Unused Bits

7	6	5	4	3	2	1	0
-	-	-	-	0	0	0	0

These bits are always set to 0.

UF - Update-Event Flag

7	6	5	4	3	2	1	0
-	-	-	UF	-	-	-	-

This bit is set to a 1 at the end of the update cycle. Reading register C clears this bit.

AF - Alarm Event Flag

7	6	5	4	3	2	1	0
-	-	AF	-	-	-	-	-

This bit is set to a 1 when an alarm event occurs. Reading register C clears this bit.

7	6	5	4	3	2	1	0
-	PF	-	-	-	-	-	-

PF - Periodic Event Flag

This bit is set to a 1 every t_{PI} time, where t_{PI} is the time period selected by the settings of RS0–RS3 in register A. Reading register C clears this bit.

INTF - Interrupt Request Flag

7	6	5	4	3	2	1	0
INTF	-	-	-	-	-	-	-

This flag is set to a 1 when any of the following is true:

AIE = 1 and AF = 1

PIE = 1 and PF = 1

UIE = 1 and UF = 1

Reading register C clears this bit.

Register D

Register D Bits							
7	6	5	4	3	2	1	0
VRT	0	0	0	0	0	0	0

Register D is the read-only data integrity status register.

Bits 0–6 - Unused Bits

7	6	5	4	3	2	1	0
-	0	0	0	0	0	0	0

These bits are always set to 0.

VRT - Valid RAM and Time

7	6	5	4	3	2	1	0
VRT	-	-	-	-	-	-	-

1 = Valid backup energy source

0 = Backup energy source is depleted

When the backup energy source is depleted (VRT = 0), data integrity of the RTC and storage registers is not guaranteed.

bq4285

Absolute Maximum Ratings

Symbol	Parameter	Value	Unit	Conditions
V_{CC}	DC voltage applied on V_{CC} relative to V_{SS}	-0.3 to 7.0	V	
V_T	DC voltage applied on any pin excluding V_{CC} relative to V_{SS}	-0.3 to 7.0	V	$V_T \leq V_{CC} + 0.3$
T_{OPR}	Operating temperature	0 to +70	°C	Commercial
T_{STG}	Storage temperature	-55 to +125	°C	
T_{BIAS}	Temperature under bias	-40 to +85	°C	
T_{SOLDER}	Soldering temperature	260	°C	For 10 seconds

Note: Permanent device damage may occur if **Absolute Maximum Ratings** are exceeded. Functional operation should be limited to the Recommended DC Operating Conditions detailed in this data sheet. Exposure to conditions beyond the operational limits for extended periods of time may affect device reliability.

Recommended DC Operating Conditions (T_A = T_{OPR})

Symbol	Parameter	Minimum	Typical	Maximum	Unit
V_{CC}	Supply voltage	4.5	5.0	5.5	V
V_{SS}	Supply voltage	0	0	0	V
V_{IL}	Input low voltage	-0.3	-	0.8	V
V_{IH}	Input high voltage	2.2	-	$V_{CC} + 0.3$	V
V_{BC}	Backup cell voltage	2.5	-	4.0	V

Note: Typical values indicate operation at $T_A = 25°C$.

DC Electrical Characteristics $(T_A = T_{OPR}, V_{CC} = 5V \pm 10\%)$

Symbol	Parameter	Minimum	Typical	Maximum	Unit	Conditions/Notes
I_{LI}	Input leakage current	-	-	± 1	μA	$V_{IN} = V_{SS}$ to V_{CC}
I_{LO}	Output leakage current	-	-	± 1	μA	AD_0–AD_7, $\overline{INT}$, and SQW in high impedance, $V_{OUT} = V_{SS}$ to V_{CC}
V_{OH}	Output high voltage	2.4	-	-	V	$I_{OH} = -2.0$ mA
V_{OL}	Output low voltage	-	-	0.4	V	$I_{OL} = 4.0$ mA
I_{CC}	Operating supply current	-	7	15	mA	Min. cycle, duty = 100%, $I_{OH} = 0$mA, $I_{OL} = 0$mA
V_{SO}	Supply switch-over voltage	-	V_{BC}	-	V	
I_{CCB}	Battery operation current	-	0.3	0.5	μA	$V_{BC} = 3V$, $T_A = 25°C$, no load on V_{OUT} or $\overline{CE}_{OUT}$
V_{PFD}	Power-fail-detect voltage	4.0	4.17	4.35	V	
V_{OUT1}	V_{OUT} voltage	$V_{CC} - 0.3V$	-	-	V	$I_{OUT} = 100$mA, $V_{CC} > V_{BC}$
V_{OUT2}	V_{OUT} voltage	$V_{BC} - 0.3V$				$I_{OUT} = 100$μA, $V_{CC} < V_{BC}$
$I_{\overline{CE}}$	Chip enable input current	-	-	100	μA	Internal 50K pull-up

Note: Typical values indicate operation at $T_A = 25°C$, $V_{CC} = 5V$ or $V_{BC} = 3V$.

Crystal Specifications (DT-26 or Equivalent)

Symbol	Parameter	Minimum	Typical	Maximum	Unit
f_O	Oscillation frequency	-	32.768	-	kHz
C_L	Load capacitance	-	6	-	pF
T_P	Temperature turnover point	20	25	30	°C
k	Parabolic curvature constant	-	-	-0.042	ppm/°C
Q	Quality factor	40,000	70,000	-	
R_1	Series resistance	-	-	45	KΩ
C_0	Shunt capacitance	-	1.1	1.8	pF
C_0/C_1	Capacitance ratio	-	430	600	
D_L	Drive level	-	-	1	μW
$\Delta f/f_O$	Aging (first year at 25°C)	-	1	-	ppm

Capacitance (T$_A$ = 25°C, F = 1MHz, V$_{CC}$ = 5.0V)

Symbol	Parameter	Minimum	Typical	Maximum	Unit	Conditions
C$_{I/O}$	Input/output capacitance	-	-	7	pF	V$_{OUT}$ = 0V
C$_{IN}$	Input capacitance	-	-	5	pF	V$_{IN}$ = 0V

Note: This parameter is sampled and not 100% tested.

AC Test Conditions

| Parameter	Test Conditions
Input pulse levels	0 to 3.0 V
Input rise and fall times	5 ns
Input and output timing reference levels	1.5 V (unless otherwise specified)
Output load (including scope and jig)	See Figures 5 and 6

Figure 5. Output Load A

Figure 6. Output Load B
Read/Write Timing (T$_A$ = T$_{OPR}$, V$_{CC}$ = 5V $\pm$ 10%)

Symbol	Parameter	Minimum	Typical	Maximum	Unit	Notes
t$_{CYC}$	Cycle time	160	-	-	ns	
t$_{DSL}$	DS low or $\overline{RD}$/$\overline{WR}$ high time	80	-	-	ns	
t$_{DSH}$	DS high or $\overline{RD}$/$\overline{WR}$ low time	55	-	-	ns	
t$_{RWH}$	R/$\overline{W}$ hold time	0	-	-	ns	
t$_{RWS}$	R/$\overline{W}$ setup time	10	-	-	ns	
t$_{CS}$	Chip select setup time	5	-	-	ns	
t$_{CH}$	Chip select hold time	0	-	-	ns	
t$_{DHR}$	Read data hold time	0	-	25	ns	
t$_{DHW}$	Write data hold time	0	-	-	ns	
t$_{AS}$	Address setup time	20	-	-	ns	
t$_{AH}$	Address hold time	5	-	-	ns	
t$_{DAS}$	Delay time, DS to AS rise	10	-	-	ns	
t$_{ASW}$	Pulse width, AS high	30	-	-	ns	
t$_{ASD}$	Delay time, AS to DS rise ($\overline{RD}$/$\overline{WR}$ fall)	35	-	-	ns	
t$_{OD}$	Output data delay time from DS rise ($\overline{RD}$ fall)	-	-	50	ns	
t$_{DW}$	Write data setup time	30	-	-	ns	
t$_{BUC}$	Delay time before update	-	244	-	µs	
t$_{PI}$	Periodic interrupt time interval	-	-	-	-	See Table 3
t$_{UC}$	Time of update cycle	-	1	-	µs

WC-5

Power-Down/Power-Up Timing $(T_A = T_{OPR})$

| Symbol	Parameter	Minimum	Typical	Maximum	Unit	Conditions
t_F	V_{CC} slew from 4.5V to 0V	300	-	-	µs	
t_R	V_{CC} slew from 0V to 4.5V	100	-	-	µs	
t_{CSR}	$\overline{CS}$ at V_{IH} after power-up	20	-	200	ms	Internal write-protection period after V_{CC} passes V_{PFD} on power-up.
t_{WPT}	Write-protect time for external RAM	10	6	30	µs	Delay after V_{CC} slews down past V_{PFD} before SRAM is write-protected.
t_{CER}	Chip enable recovery time	t_{CSR}	-	t_{CSR}	ms	Time during which external SRAM is write-protected after V_{CC} passes V_{PFD} on power-up.
t_{CED}	Chip enable propagation delay to external SRAM	-	7	10	ns	

Caution: **Negative undershoots below the absolute maximum rating of -0.3V in battery-backup mode may affect data integrity.**

Power-Down/Power-Up Timing
Interrupt Delay Timing $(T_A = T_{OPR})$

Symbol	Parameter	Minimum	Typical	Maximum	Unit
t_{RSW}	Reset pulse width	5	-	-	µs
t_{IRR}	$\overline{INT}$ release from $\overline{RST}$	-	-	2	µs
t_{IRD}	$\overline{INT}$ release from DS ($\overline{RD}$)	-	-	2	µs

PACKAGING INFORMATION

Orderable Device	Status [1]	Package Type	Package Drawing	Pins	Package Qty	Eco Plan [2]	Lead/Ball Finish	MSL Peak Temp [3]
BQ4285P-SB2	ACTIVE	PDIP	N	24	15	TBD	Call TI	Level-NA-NA-NA
BQ4285S-SB2	ACTIVE	SOIC	DW	24	25	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR
BQ4285S-SB2TR	ACTIVE	SOIC	DW	24	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR

[1] The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

[2] Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS) or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)
[3] MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:
- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits,General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:
- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
