

The following document contains information on Cypress products. The document has the series name, product name, and ordering part numbering with the prefix “MB”. However, Cypress will offer these products to new and existing customers with the series name, product name, and ordering part number with the prefix “CY”.

How to Check the Ordering Part Number

1. Go to www.cypress.com/pcn.
2. Enter the keyword (for example, ordering part number) in the **SEARCH PCNS** field and click **Apply**.
3. Click the corresponding title from the search results.
4. Download the Affected Parts List file, which has details of all changes

About Cypress

Cypress is the leader in advanced embedded system solutions for the world's most innovative automotive, industrial, smart home appliances, consumer electronics and medical products. Cypress' microcontrollers, analog ICs, wireless and USB-based connectivity solutions and reliable, high-performance memories help engineers design differentiated products and get them to market first. Cypress is committed to providing customers with the best support and development resources on the planet enabling them to disrupt markets by creating new product categories in record time. The MB9AB40NB Series are highly integrated 32-bit microcontrollers dedicated for embedded controllers with low-power consumption mode and competitive cost.

These series are based on the ARM Cortex-M3 Processor with on-chip Flash memory and SRAM, and have peripheral functions such as various timers, ADCs, LCDC and Communication Interfaces (USB, UART, CSIO, I²C).

The products which are described in this data sheet are placed into TYPE6 product categories in FM3 Family Peripheral Manual.

Features

32-bit ARM Cortex-M3 Core

- Processor version: r2p1
- Up to 40 MHz Frequency Operation
- Integrated Nested Vectored Interrupt Controller (NVIC): 1 NMI (non-maskable interrupt) and 48 peripheral interrupts and 16 priority levels
- 24-bit System timer (Sys Tick): System timer for OS task management

On-chip Memories

[Flash memory]

- Dual operation Flash memory
 - Dual Operation Flash memory has the upper bank and the lower bank. So, this series could implement erase, write and read operations for each bank simultaneously.
 - Main area: Up to 256 Kbytes (Up to 240 Kbytes upper bank + 16 Kbytes lower bank)
 - Work area: 32 Kbytes (lower bank)
- Read cycle: 0 wait-cycle
- Security function for code protection

[SRAM]

This Series on-chip SRAM is composed of two independent SRAM (SRAM0, SRAM1). SRAM0 is connected to I-code bus and D-code bus of Cortex-M3 core. SRAM1 is connected to System bus.

- SRAM0: Up to 16 Kbytes
- SRAM1: Up to 16 Kbytes

External Bus Interface*

- Supports SRAM, NOR Flash memory device
- Up to 8 chip selects
- 8-/16-bit Data width
- Up to 25-bit Address bit
- Maximum area size : Up to 256 Mbytes
- Supports Address/Data multiplex
- Supports external RDY function

*: MB9AFB41LB, FB42LB and FB44LB do not support External Bus Interface.

USB Interface

The USB interface is composed of Device and Host. PLL for USB is built-in, USB clock can be generated by multiplication of Main clock.

[USB device]

- USB2.0 Full-Speed supported
- Max 6 EndPoint supported
 - EndPoint 0 is control transfer
 - EndPoint 1, 2 can select Bulk-transfer, Interrupt-transfer or Isochronous-transfer
 - EndPoint 3 to 5 can select Bulk-transfer or Interrupt-transfer
 - EndPoint 1 to 5 is comprised of Double Buffers.
 - The size of each endpoint is according to the follows.
 - Endpoint 0, 2 to 5: 64 bytes
 - Endpoint 1: 256 bytes

[USB host]

- USB2.0 Full/Low-speed supported
- Bulk-transfer, interrupt-transfer and Isochronous-transfer support
- USB Device connected/disconnected automatic detection
- Automatic processing of the IN/OUT token handshake packet
- Max 256-byte packet-length supported
- Wake-up function supported

LCD Controller (LCDC)

- Up to 40 SEG × 8 COM
- 8 COM or 4 COM mode can be selected.
- Built-in internal dividing resistor
- LCD drive power supply (bias) pin (VV4 to VV0)
- With blinking function

Multi-function Serial Interface (Max 8channels)

- 4 channels with 16steps×9-bit FIFO (ch.4 to ch.7), 4 channels without FIFO (ch.0 to ch.3)
- Operation mode is selectable from the following for each channel.
 - UART
 - CSIO
 - I²C

[UART]

- Full-duplex double buffer
- Selection with or without parity supported
- Built-in dedicated baud rate generator
- External clock available as a serial clock
- Hardware Flow control*: Automatically control the transmission by CTS/RTS (only ch.4)
- Various error detection functions available (parity errors, framing errors, and overrun errors)

*: MB9AFB41LB, FB42LB and FB44LB do not support Hardware Flow control.

[CSIO]

- Full-duplex double buffer
- Built-in dedicated baud rate generator
- Overrun error detection function available

[I²C]

Standard-mode (Max 100 kbps) / Fast-mode (Max 400 kbps) supported

DMA Controller (8 channels)

The DMA Controller has an independent bus from the CPU, so CPU and DMA Controller can process simultaneously.

- 8 independently configured and operated channels
- Transfer can be started by software or request from the built-in peripherals
- Transfer address area: 32-bit (4 Gbytes)
- Transfer mode: Block transfer/Burst transfer/Demand transfer
- Transfer data type: byte/half-word/word
- Transfer block count: 1 to 16
- Number of transfers: 1 to 65536

A/D Converter (Max 24 channels)

[12-bit A/D Converter]

- Successive Approximation type
- Built-in 2 units
- Conversion time: 2.0 μs @ 2.7 V to 3.6 V
- Priority conversion available (priority at 2 levels)
- Scanning conversion mode
- Built-in FIFO for conversion data storage (for SCAN conversion: 16 steps, for Priority conversion: 4 steps)

Base Timer (Max 8 channels)

Operation mode is selectable from the following for each channel.

- 16-bit PWM timer
- 16-bit PPG timer
- 16-/32-bit reload timer
- 16-/32-bit PWC timer

General-Purpose I/O Port

This series can use its pins as general-purpose I/O ports when they are not used for external bus or peripherals. Moreover, the port relocate function is built in. It can set which I/O port the peripheral function can be allocated to.

- Capable of pull-up control per pin
- Capable of reading pin level directly
- Built-in the port relocate function
- Up to 83 fast general-purpose I/O Ports@100 pin Package
- Some ports are 5 V tolerant.

See [Pin Assignment](#) to confirm the corresponding pins.

Dual Timer (32-/16-bit Down Counter)

The Dual Timer consists of two programmable 32-/16-bit down counters.

Operation mode is selectable from the following for each channel.

- Free-running
- Periodic (=Reload)
- One-shot

HDMI-CEC/Remote Control Receiver (Up to 2 channels)

[HDMI-CEC transmitter]

- Header block automatic transmission by judging Signal free
- Generating status interrupt by detecting Arbitration lost
- Generating START, EOM, ACK automatically to output CEC transmission by setting 1 byte data
- Generating transmission status interrupt when transmitting 1 block (1 byte data and EOM/ACK)

[HDMI-CEC receiver]

- Automatic ACK reply function available
- Line error detection function available

[Remote control receiver]

- 4 bytes reception buffer
- Repeat code detection function available

Real-time clock (RTC)

The Real-time clock can count year/Month/Day/Hour/Minute/Second/A day of the week from 00 to 99.

- The interrupt function with specifying date and time (Year/Month/Day/Hour/Minute) is available. This function is also available by specifying only Year, Month, Day, Hour or Minute.
- Timer interrupt function after set time or each set time.
- Capable of rewriting the time with continuing the time count.
- Leap year automatic count is available.

Watch Counter

- The Watch counter is used for wake up from sleep and timer mode.
- Interval timer: up to 64 s (Max) @ Sub Clock: 32.768 kHz

External Interrupt Controller Unit

- Up to 16 external interrupt input pins
- Include one non-maskable interrupt (NMI) input pin

Watchdog Timer (2 channels)

- A watchdog timer can generate interrupts or a reset when a time-out value is reached.
- This series consists of two different watchdogs, a Hardware watchdog and a Software watchdog.
- The Hardware watchdog timer is clocked by the built-in low-speed CR oscillator. Therefore, the Hardware watchdog is active in any low-power consumption modes except RTC, Stop, Deep Standby RTC, Deep Standby Stop modes.

CRC (Cyclic Redundancy Check) Accelerator

The CRC accelerator calculates the CRC which has a heavy software processing load, and achieves a reduction of the integrity check processing load for reception data and storage.

CCITT CRC16 and IEEE-802.3 CRC32 are supported.

- CCITT CRC16 Generator Polynomial: 0x1021
- IEEE-802.3 CRC32 Generator Polynomial: 0x04C11DB7

Clock and Reset

[Clocks]

- Selectable from five clock sources (2 external oscillators, 2 built-in CR oscillators, and Main PLL).
- Main Clock: 4 MHz to 48 MHz
- Sub Clock: 32.768 kHz
- Built-in high-speed CR Clock: 4 MHz
- Built-in low-speed CR Clock: 100 kHz
- Main PLL Clock

[Resets]

- Reset requests from INITX pin
- Power on reset
- Software reset
- Watchdog timers reset
- Low-voltage detection reset
- Clock Super Visor reset

Clock Super Visor (CSV)

Clocks generated by built-in CR oscillators are used to supervise abnormality of the external clocks.

- External clock failure (clock stop) is detected, reset is asserted.
- External frequency anomaly is detected, interrupt or reset is asserted.

Low-Voltage Consumption Detector (LVD)

- This Series includes 2-stage monitoring of voltage on the VCC pins. When the voltage falls below the voltage that has been set, Low-Voltage Detector generates an interrupt or reset.
- LVD1: error reporting via interrupt
- LVD2: auto-reset operation

Low-Power Consumption Mode

- Six low-power consumption modes supported.
 - Sleep
 - Timer
 - RTC
 - Stop
 - Deep Standby RTC (selectable between keeping the value of RAM and not)
 - Deep Standby Stop (selectable between keeping the value of RAM and not)

Debug

- Serial Wire JTAG Debug Port (SWJ-DP)
- Embedded Trace Macrocells (ETM).*

*: MB9AFB41LB/MB, FB42LB/MB, FB44LB/MB support only SWJ-DP.

Unique ID

Unique value of the device (41-bit) is set.

Power Supply

Wide range voltage:

VCC = 1.65 V to 3.6 V

VCC = 3.0 V to 3.6 V (when USB is used)

VCC = 2.2 V to 3.6 V (when LCDC is used)

3. Pin Assignment

LQ1100

Note:

- The number after the underscore ("_") in pin names such as XXX_1 and XXX_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

PQH100

Note:

- The number after the underscore ("_") in pin names such as XXX_1 and XXX_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

LQH080/LQJ080

Note:

- The number after the underscore ("_") in pin names such as XXX_1 and XXX_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

LQD064/LQG064

Note:

- The number after the underscore ("_") in pin names such as XXX_1 and XXX_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

VNC064

Note:

- The number after the underscore ("_") in pin names such as XXX_1 and XXX_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

LBC112

Note:

- The number after the underscore ("_") in pin names such as XXX_1 and XXX_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

FDG096

Note:

- The number after the underscore ("_") in pin names such as XXX_1 and XXX_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

4. List of Pin Functions

4.1 List of Pin Numbers

The number after the underscore ("_") in pin names such as XXX_1 and XXX_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

4.2 List of Pin Functions

The number after the underscore ("_") in pin names such as XXX_1 and XXX_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

Note:

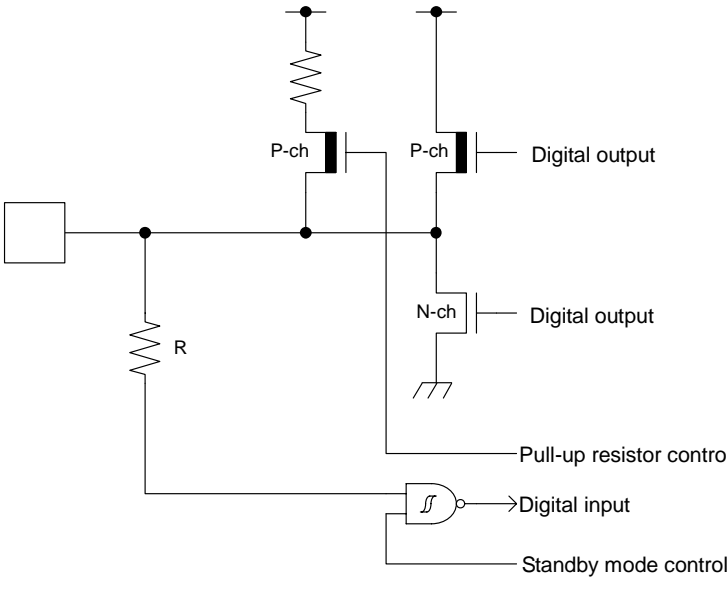

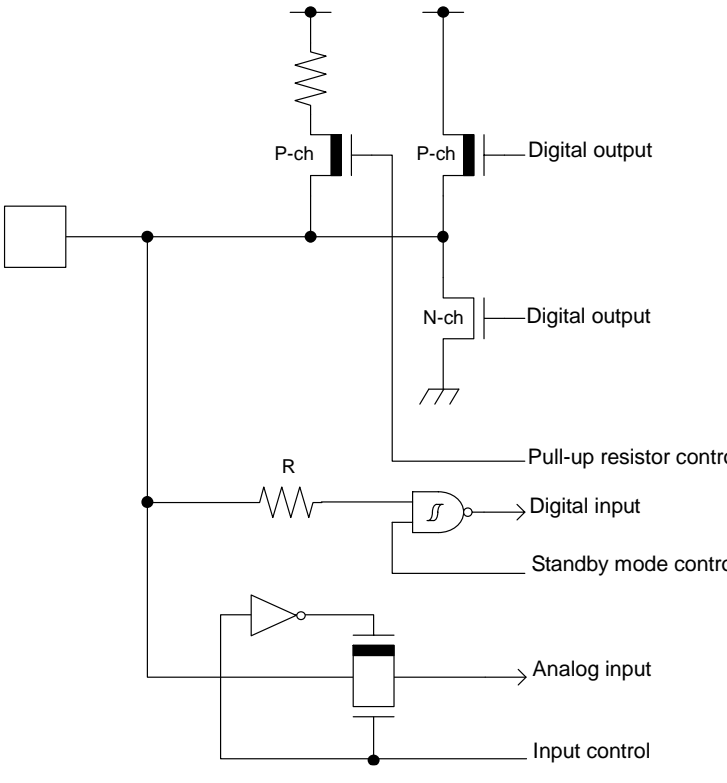

- While this device contains a Test Access Port (TAP) based on the IEEE 1149.1-2001 JTAG standard, it is not fully compliant to all requirements of that standard. This device may contain a 32-bit device ID that is the same as the 32-bit device ID in other devices with different functionality. The TAP pins may also be configurable for purposes other than access to the TAP controller.

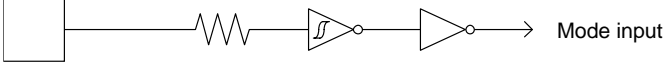

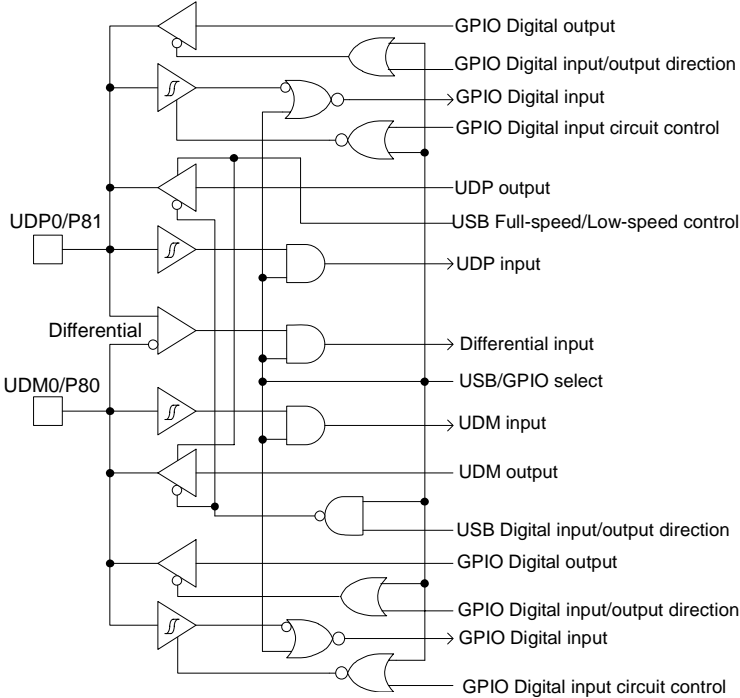

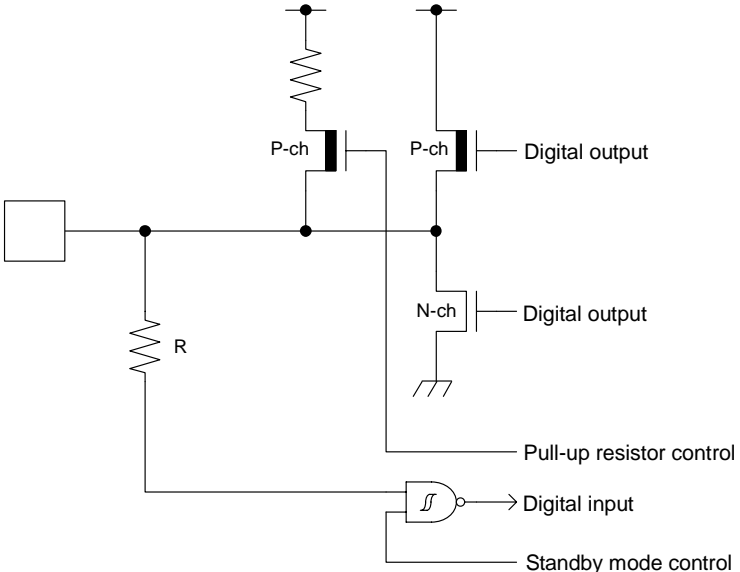

5. I/O Circuit Type

| Type | Circuit | Remarks |
|------|---|--|
| A | <p>The diagram illustrates two I/O channels, X1 and X0. Each channel consists of a pull-up resistor connected to a supply rail. The signal line from the resistor passes through a series of logic components: an AND gate (Digital input), an AND gate (Standby mode control), an AND gate (Clock input), and another AND gate (Standby mode control). The signal then reaches a P-channel MOSFET (P-ch) and an N-channel MOSFET (N-ch) driver stage. The P-ch MOSFET is connected to a supply rail and a pull-up resistor, while the N-ch MOSFET is connected to ground. The outputs are labeled as Digital output and Digital output. A Pull-up resistor control signal is also shown.</p> | <p><i>It is possible to select the main oscillation / GPIO function</i></p> <p><i>When the main oscillation is selected.</i></p> <ul style="list-style-type: none"> - Oscillation feedback resistor: Approximately 1 MΩ - With Standby mode control - When the GPIO is selected. - CMOS level output. - CMOS level hysteresis input - With pull-up resistor control - With standby mode control - Pull-up resistor: Approximately 33 kΩ - $I_{OH} = -4 \text{ mA}$, $I_{OL} = 4 \text{ mA}$ |

6. Handling Precautions

Any semiconductor device has inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Cypress semiconductor devices.

6.1 Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

Processing and Protection of Pins

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

1. Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

2. Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device. Therefore, avoid this type of connection.

3. Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

Latch-up

Semiconductor devices are constructed by the formation of P-type and N-type areas on a substrate. When subjected to abnormally high voltages, internal parasitic PNP junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred mA to flow continuously at the power supply pin. This condition is called latch-up.

CAUTION: The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

1. Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.
2. Be sure that abnormal current flows do not occur during the power-on sequence.

Observance of Safety Regulations and Standards

Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

Fail-Safe Design

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

Precautions Related to Usage of Devices

Cypress semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION: Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

6.2 Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Cypress's recommended conditions. For detailed information about mount conditions, contact your sales representative.

Lead Insertion Type

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Cypress recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Cypress Inc. recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Cypress ranking of recommended conditions.

Lead-Free Packaging

CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

1. Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.
2. Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5°C and 30°C.
When you open Dry Package that recommends humidity 40% to 70% relative humidity.
3. When necessary, Cypress Inc. packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
4. Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Cypress recommended conditions for baking.

Condition: 125°C/24 h

Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

1. Maintain relative humidity in the working environment between 40% and 70%. Use of an apparatus for ion generation may be needed to remove electricity.
2. Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.
3. Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ).
Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.
4. Ground all fixtures and instruments, or protect with anti-static measures.
5. Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

6.3 Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

1. Humidity

Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.

2. Discharge of Static Electricity

When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.

3. Corrosive Gases, Dust, or Oil

Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.

4. Radiation, Including Cosmic Radiation

Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.

5. Smoke, Flame

CAUTION: Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Cypress products in other special environmental conditions should consult with sales representatives.

7. Handling Devices

Power supply pins

In products with multiple VCC and VSS pins, respective pins at the same potential are interconnected within the device in order to prevent malfunctions such as latch-up. However, all of these pins should be connected externally to the power supply or ground lines in order to reduce electromagnetic emission levels, to prevent abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total output current rating.

Moreover, connect the current supply source with each Power supply pin and GND pin of this device at low impedance. It is also advisable that a ceramic capacitor of approximately 0.1 μF be connected as a bypass capacitor between each Power supply pin and GND pin, between AVCC pin and AVSS pin near this device.

Stabilizing supply voltage

A malfunction may occur when the power supply voltage fluctuates rapidly even though the fluctuation is within the recommended operating conditions of the VCC power supply voltage. As a rule, with voltage stabilization, suppress the voltage fluctuation so that the fluctuation in VCC ripple (peak-to-peak value) at the commercial frequency (50 Hz/60 Hz) does not exceed 10% of the VCC value in the recommended operating conditions, and the transient fluctuation rate does not exceed 0.1 V/ μs when there is a momentary fluctuation on switching the power supply.

Crystal oscillator circuit

Noise near the X0/X1 and X0A/X1A pins may cause the device to malfunction. Design the printed circuit board so that X0/X1, X0A/X1A pins, the crystal oscillator, and the bypass capacitor to ground are located as close to the device as possible.

It is strongly recommended that the PC board artwork be designed such that the X0/X1 and X0A/X1A pins are surrounded by ground plane as this is expected to produce stable operation.

Evaluate oscillation of your using crystal oscillator by your mount board.

Sub crystal oscillator

This series sub oscillator circuit is low gain to keep the low current consumption.

The crystal oscillator to fill the following conditions is recommended for sub crystal oscillator to stabilize the oscillation.

Surface mount type

Size: More than 3.2 mm x 1.5 mm

Load capacitance: Approximately 6 pF to 7 pF Lead type

Load capacitance: Approximately 6 pF to 7 pF

Using an external clock

When using an external clock as an input of the main clock, set X0/X1 to the external clock input, and input the clock to X0.

X1(PE3) can be used as a general-purpose I/O port.

Similarly, when using an external clock as an input of the sub clock, set X0A/X1A to the external clock input, and input the clock to X0A. X1A (P47) can be used as a general-purpose I/O port.

Handling when using Multi-function serial pin as I²C pin

If it is using the multi-function serial pin as I²C pins, P-ch transistor of digital output is always disabled. However, I²C pins need to keep the electrical characteristic like other pins and not to connect to the external I²C bus system with power OFF.

C Pin

This series contains the regulator. Be sure to connect a smoothing capacitor (C_s) for the regulator between the C pin and the GND pin. Please use a ceramic capacitor or a capacitor of equivalent frequency characteristics as a smoothing capacitor.

However, some laminated ceramic capacitors have the characteristics of capacitance variation due to thermal fluctuation (F characteristics and Y5V characteristics). Please select the capacitor that meets the specifications in the operating conditions to use by evaluating the temperature characteristics of a capacitor.

A smoothing capacitor of about 4.7 μ F would be recommended for this series.

Mode pins (MD0)

Connect the MD pin (MD0) directly to VCC or VSS pins. Design the printed circuit board such that the pull-up/down resistance stays low, as well as the distance between the mode pins and VCC pins or VSS pins is as short as possible and the connection impedance is low, when the pins are pulled-up/down such as for switching the pin level and rewriting the Flash memory data. It is because of preventing the device erroneously switching to test mode due to noise.

Notes on power-on

Turn power on/off in the following order or at the same time.

If not using the A/D converter, connect AVCC = VCC and AVSS = VSS.

Turning on : VCC → AVCC → AVRH

Turning off : AVRH → AVCC → VCC

Serial Communication

There is a possibility to receive wrong data due to the noise or other causes on the serial communication.

Therefore, design a printed circuit board so as to avoid noise.

Consider the case of receiving wrong data due to noise, perform error detection such as by applying a checksum of data at the end. If an error is detected, retransmit the data.

Differences in features among the products with different memory sizes and between Flash memory products and MASK products

The electric characteristics including power consumption, ESD, latch-up, noise characteristics, and oscillation characteristics among the products with different memory sizes and between Flash memory products and MASK products are different because chip layout and memory structures are different.

If you are switching to use a different product of the same series, please make sure to evaluate the electric characteristics.

Pull-Up function of 5 V tolerant I/O

Please do not input the signal more than VCC voltage at the time of Pull-Up function use of 5 V tolerant I/O.

11. Pin Status in Each CPU State

The terms used for pin status have the following meanings.

- INITX=0

This is the period when the INITX pin is the L level.

- INITX=1

This is the period when the INITX pin is the H level.

- SPL=0

This is the status that the standby pin level setting bit (SPL) in the standby mode control register (STB_CTL) is set to 0.

- SPL=1

This is the status that the standby pin level setting bit (SPL) in the standby mode control register (STB_CTL) is set to 1.

- Input enabled

Indicates that the input function can be used.

- Internal input fixed at 0

This is the status that the input function cannot be used. Internal input is fixed at L.

- Hi-Z

Indicates that the pin drive transistor is disabled and the pin is put in the Hi-Z state.

- Setting disabled

Indicates that the setting is disabled.

- Maintain previous state

Maintains the state that was immediately prior to entering the current mode.

If a built-in peripheral function is operating, the output follows the peripheral function.

If the pin is being used as a port, that output is maintained.

- Analog input is enabled

Indicates that the analog input is enabled.

- Trace output

Indicates that the trace function can be used.

- GPIO selected

In Deep standby mode, pins switch to the general-purpose I/O port.

12. Electrical Characteristics

12.1 Absolute Maximum Ratings

| Parameter | Symbol | Rating | | Unit | Remarks |
|---|----------------------|----------------|------------------------------------|------|-----------------------------|
| | | Min | Max | | |
| Power supply voltage ^{[1],[2]} | V_{CC} | $V_{SS} - 0.5$ | $V_{SS} + 4.6$ | V | |
| Analog power supply voltage ^{[1],[3]} | AV_{CC} | $V_{SS} - 0.5$ | $V_{SS} + 4.6$ | V | |
| Analog reference voltage ^{[1],[3]} | $AVRH$ | $V_{SS} - 0.5$ | $V_{SS} + 4.6$ | V | |
| LCD input voltage ^{[1],[3]} | V_{V0} to V_{V4} | $V_{SS} - 0.5$ | $V_{SS} + 4.6$ | V | |
| Input voltage ^[1] | V_I | $V_{SS} - 0.5$ | $V_{CC} + 0.5$ (≤ 4.6 V) | V | |
| | | $V_{SS} - 0.5$ | $V_{SS} + 6.5$ | V | 5 V tolerant |
| Analog pin input voltage ^[1] | V_{IA} | $V_{SS} - 0.5$ | $AV_{CC} + 0.5$ (≤ 4.6 V) | V | |
| Output voltage ^[1] | V_O | $V_{SS} - 0.5$ | $V_{CC} + 0.5$ (≤ 4.6 V) | V | |
| L level maximum output current ^[4] | I_{OL} | - | 10 | mA | |
| | | | 39 | mA | P81/UDP0 , P80/UDM0 pins |
| L level average output current ^[5] | I_{OLAV} | - | 4 | mA | |
| | | | 10.5 | mA | [7] |
| | | | 27 | mA | [8] |
| L level total maximum output current | $\sum I_{OL}$ | - | 100 | mA | |
| L level total average output current ^[6] | $\sum I_{OLAV}$ | - | 50 | mA | |
| H level maximum output current ^[4] | I_{OH} | - | - 10 | mA | |
| | | | 39 | mA | P81/UDP0 , P80/UDM0 pins |
| H level average output current ^[5] | I_{OHAV} | - | - 4 | mA | |
| | | | 12 | mA | [7] |
| | | | 27 | mA | [8] |
| H level total maximum output current | $\sum I_{OH}$ | - | - 100 | mA | |
| H level total average output current ^[6] | $\sum I_{OHAV}$ | - | - 50 | mA | |
| Power consumption | P_D | - | 300 | mW | |
| Storage temperature | T_{STG} | - 55 | + 150 | °C | |

1: These parameters are based on the condition that $V_{SS} = AV_{SS} = 0V$.

2: V_{CC} must not drop below $V_{SS} - 0.5V$.

3: Ensure that the voltage does not to exceed $V_{CC} + 0.5$ V, for example, when the power is turned on.

4: The maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.

5: The average output current is defined as the average current value flowing through any one of the corresponding pins for a 100 ms period.

6: The total average output current is defined as the average current value flowing through all of corresponding pins for a 100ms.

7: When P81/UDP0 and P80/UDM0 pins are used as GPIO (P81, P80).

8: Then P81/UDP0 and P80/UDM0 pins are used as USB (UDP0, UDM0).

WARNING:

- Semiconductor devices may be permanently damaged by application of stress (including, without limitation, voltage, current or temperature) in excess of absolute maximum ratings. Do not exceed any of these ratings.

12.2 Recommended Operating Conditions
 $(V_{SS} = AV_{SS} = 0.0V)$

| | AVRL | - | AV_{CC} | AV_{SS} | V | $AV_{CC} < 2.7 V$ |
| Smoothing capacitor | C_S | - | 1 | 10 | μF | For Regulator ^[5] |
| Operating temperature | T_A | - | - 40 | + 85 | $^{\circ}C$ | |

1: When P81/UDP0 and P80/UDM0 pins are used as GPIO (P81, P80).

2: When P81/UDP0 and P80/UDM0 pins are used as USB (UDP0, UDM0).

3: When LCD Controller is used.

4: When LCD Controller is not used.

5: See [C Pin](#) in [Handling Devices](#) for the connection of the smoothing capacitor.

6: In between less than the minimum power supply voltage and low voltage reset/interrupt detection voltage or more, instruction execution and low voltage detection function by built-in High-speed CR(including Main PLL is used) or built-in Low-speed CR is possible to operate only.

WARNING:

- The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated under these conditions. Any use of semiconductor devices will be under their recommended operating condition. Operation under any conditions other than these conditions may adversely affect reliability of device and could result in device failure. No warranty is made with respect to any use, operating conditions or combinations not represented on this data sheet. If you are considering application under any conditions other than listed herein, please contact sales representatives beforehand.

| Frequency stabilization time | t_{CRWT} | - | - | - | 30 | μs | [2] |

1: In the case of using the values in CR trimming area of Flash memory at shipment for frequency/temperature trimming.

2: This is the time to stabilize the frequency of High-speed CR clock after setting trimming value.
This period is able to use High-speed CR clock as source clock.

Built-in Low-speed CR
 $(V_{CC} = 1.65V \text{ to } 3.6V, V_{SS} = 0V, T_A = -40^\circ C \text{ to } +85^\circ C)$

| USB clock frequency ^[3] | f _{CLKSPLL} | - | - | 48 | MHz | After the M frequency division |

1: Time from when the PLL starts operating until the oscillation stabilizes.

2: For more information about Main PLL clock (CLKPLL), see Chapter 2-1: Clock in FM3 Family Peripheral Manual.

3: For more information about USB clock, see Chapter 2-2: USB Clock Generation in FM3 Family Peripheral Manual Communication Macro Part.

Operating Conditions of Main PLL (In the case of using the built-in High-speed CR for the input clock of the Main PLL)
 $(V_{CC} = 1.65V \text{ to } 3.6V, V_{SS} = 0V, T_A = -40^\circ C \text{ to } +85^\circ C)$

| Parameter | Symbol | Value | | | Unit | Remarks |
|--|---------------------|-------|-----|-----|----------|---------|
| | | Min | Typ | Max | | |
| PLL oscillation stabilization wait time ^[1] (LOCK UP time) | t _{LOCK} | 100 | - | - | μs | |
| PLL input clock frequency | f _{PLLI} | 3.8 | 4 | 4.2 | MHz | |
| PLL multiple rate | - | 19 | - | 35 | multiple | |
| PLL macro oscillation clock frequency | f _{PLLO} | 72 | - | 150 | MHz | |
| Main PLL clock frequency ^[2] | f _{CLKPLL} | - | - | 40 | MHz | |

1: Time from when the PLL starts operating until the oscillation stabilizes.

2: For more information about Main PLL clock (CLKPLL), see Chapter 2-1: Clock in FM3 Family Peripheral Manual.

Note:

- Make sure to input to the Main PLL source clock, the High-speed CR clock (CLKHC) that the frequency/temperature has been trimmed. When setting PLL multiple rate, please take the accuracy of the built-in High-speed CR clock into account and prevent the master clock from exceeding the maximum frequency.

12.5.5 Reset Input Characteristics

($V_{CC} = 1.65V$ to $3.6V$, $V_{SS} = 0V$, $T_A = -40^{\circ}C$ to $+85^{\circ}C$)

| Parameter | Symbol | Pin name | Conditions | Value | | Unit | Remarks |

| | | | | Min | Max | | |
| Reset input time | t_{INITX} | INITX | - | 500 | - | ns | |

12.5.6 Power-on Reset Timing

(V_{SS} = 0V, T_A = - 40°C to + 85°C)

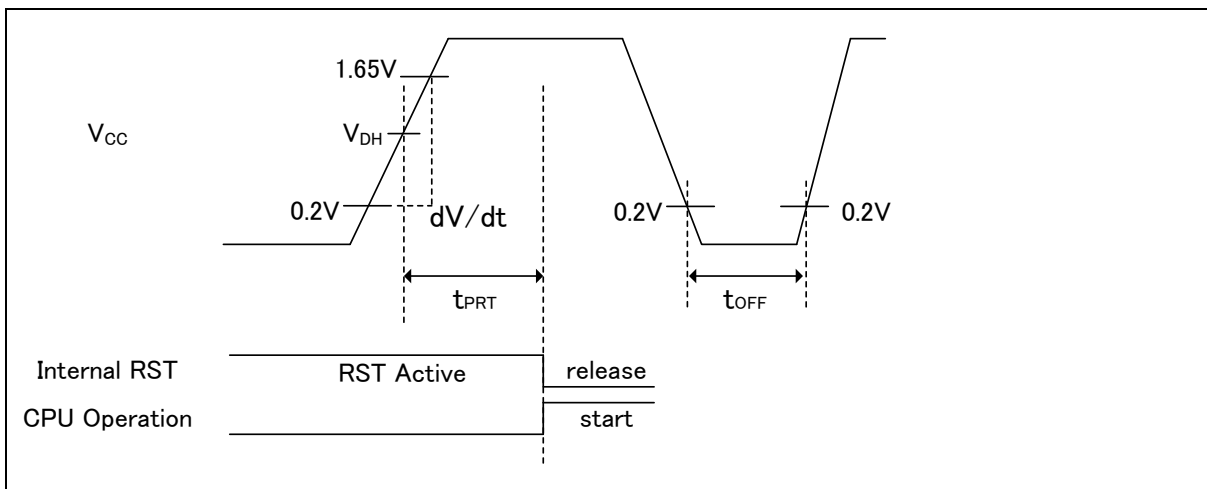

| Parameter | Symbol | Pin name | Conditions | Value | | | Unit | Remarks |
|-------------------------------------|------------------|----------|----------------------------------|-------|-----|-------|-------|---------|
| | | | | Min | Typ | Max | | |
| Power supply shut down time | t _{OFF} | VCC | - | 1 | - | - | ms | *1 |
| Power ramp rate | dV/dt | | V _{CC} :0.2 V to 1.65 V | 0.2 | - | 1000 | mV/μs | *2 |
| Time until releasing Power-on reset | t _{PRT} | | - | 1.34 | - | 16.09 | ms | |

*1: V_{CC} must be held below 0.2 V for minimum period of t_{OFF}. Improper initialization may occur if this condition is not met.

*2: This dV/dt characteristic is applied at the power-on of cold start (t_{OFF}>1 ms).

Note:

- If t_{OFF} cannot be satisfied designs must assert external reset(INITX) at power-up and at any brownout event per “13. 5. Reset Input Characteristics”.

12.5.7 External Bus Timing

External bus clock output characteristics

($V_{CC} = 1.65V$ to $3.6V$, $V_{SS} = 0V$, $T_A = -40^{\circ}C$ to $+85^{\circ}C$)

| Parameter | Symbol | Pin name | Conditions | Value | | Unit |
|------------------|-------------|----------|--------------------|-------|-----|------|
| | | | | Min | Max | |
| Output frequency | t_{CYCLE} | MCLKOUT* | $V_{CC} \geq 2.7V$ | - | 40 | MHz |
| | | | $V_{CC} < 2.7V$ | - | 20 | MHz |

*: The external bus clock output (MCLKOUT) is a divided clock of HCLK.

For more information about setting of clock divider, see Chapter 12: External Bus Interface in FM3 Family Peripheral Manual. When external bus clock is not output, this characteristic does not give any effect on external bus operation.

External bus signal input/output characteristics

($V_{CC} = 1.65V$ to $3.6V$, $V_{SS} = 0V$, $T_A = -40^{\circ}C$ to $+85^{\circ}C$)

1: R and C represent the pull-up resistor and load capacitance of the SCL and SDA lines, respectively. V_p indicates the power supply voltage of the pull-up resistor and I_{OL} indicates V_{OL} guaranteed current.

2: The maximum t_{HDDAT} must satisfy that it does not extend at least L period (t_{LOW}) of device's SCL signal.

3: A Fast-mode I²C bus device can be used on a Standard-mode I²C bus system as long as the device satisfies the requirement of t_{SUDAT} ≥ 250 ns.

4: t_{CYCP} is the APB bus clock cycle time. About the APB bus number that I²C is connected to, see Block Diagram in this data sheet. To use Standard-mode, set the APB bus clock at 2 MHz or more. To use Fast-mode, set the APB bus clock at 8 MHz or more.

1: The conversion time is the value of sampling time (t_s) + compare time (t_c).

The condition of the minimum conversion time is the following.

$AV_{CC} \geq 2.7 V$, HCLK=40 MHz sampling time: 0.6 μs , compare time: 1.4 μs

$1.8 V \leq AV_{CC} < 2.7 V$, HCLK=40 MHz sampling time: 1.2 μs , compare time: 2.8 μs

$1.65 V \leq AV_{CC} < 1.8 V$, HCLK=40 MHz sampling time: 3 μs , compare time: 7 μs

Ensure that it satisfies the value of the sampling time (t_s) and compare clock cycle (t_{CK}).

For setting of the sampling time and the compare clock cycle, see Chapter 1-1: A/D Converter in FM3 Family Peripheral Manual Analog Macro Port.

The register setting of the A/D Converter are reflected in the operation according to the APB bus clock timing.

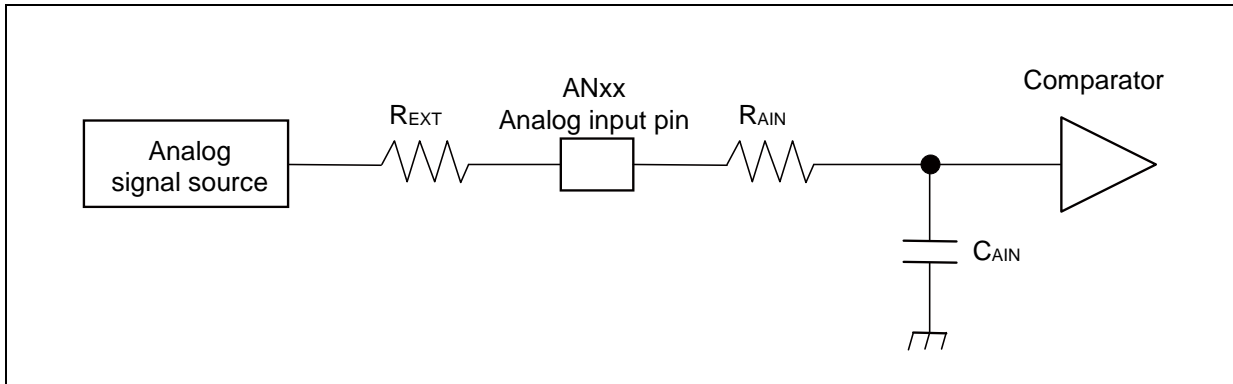

The sampling clock and compare clock is generated from the Base clock (HCLK).

About the APB bus number which the A/D Converter is connected to, see Block Diagram in this data sheet.

2: A necessary sampling time changes by external impedance.

Ensure that it set the sampling time to satisfy (Equation 1).

3: The compare time (t_c) is the value of (Equation 2).

(Equation 1) $t_s \geq (R_{AIN} + R_{EXT}) \times C_{AIN} \times 9$

t_s : Sampling time[ns]

R_{AIN} : Input resistor of A/D[k Ω] = 2.2 k Ω at 2.7 V \leq AV_{CC} \leq 3.6 V

Input resistor of A/D[k Ω] = 5.5 k Ω at 1.8 V \leq AV_{CC} \leq 2.7 V

Input resistor of A/D[k Ω] = 10.5 k Ω at 1.65 V \leq AV_{CC} \leq 1.8 V

C_{AIN} : Input capacity of A/D[pF] = 9.4 pF at 1.65 V \leq AV_{CC} \leq 3.6 V

R_{EXT} : Output impedance of external circuit[k Ω]

(Equation 2) $t_c = t_{CCK} \times 14$

t_c : Compare time

t_{CCK} : Compare clock cycle

Definition of 12-bit A/D Converter Terms

- Resolution: Analog variation that is recognized by an A/D converter.
- Integral Nonlinearity: Deviation of the line between the zero-transition point (0b000000000000 ↔ 0b000000000001) and the full-scale transition point (0b111111111110 ↔ 0b111111111111) from the actual conversion characteristics.
- Differential Nonlinearity: Deviation from the ideal value of the input voltage that is required to change the output code by 1 LSB.

1: The switching threshold voltage of Single-End-Receiver of USB I/O buffer is set as within V_{IL} (Max) = 0.8V, V_{IH} (Min) = 2.0 V (TTL input standard). There are some hysteresis to lower noise sensitivity.

2: Use the differential-Receiver to receive the USB differential data signal.

The Differential-Receiver has 200 mV of differential input sensitivity when the differential data input is within 0.8 V to 2.5 V to the local ground reference level. Above voltage range is the common mode input voltage range.

3: The output drive capability of the driver is below 0.3 V at Low-State (V_{OL}) (to 3.6 V and 1.5 k Ω load), and 2.8 V or above (to ground and 15 k Ω load) at High-State (V_{OH}).

4: The cross voltage of the external differential output signal ($D + /D -$) of USB I/O buffer is within 1.3 V to 2.0 V.

5: They indicate the rising time (T_{rise}) and falling time (T_{fall}) of the full-speed differential data signal. They are defined by the time between 10% and 90% of the output signal voltage. For full-speed buffer, T_r/T_f ratio is regulated as within $\pm 10\%$ to minimize RFI emission.

6: USB Full-speed connection is performed via twist pair cable shield with $90\Omega \pm 15\%$ characteristic impedance (Differential Mode). USB standard defines that output impedance of USB driver must be in range from 28Ω to 44Ω . So, discrete series resistor (R_s) addition is defined in order to satisfy the above definition and keep balance. When using this USB I/O, use it with 25Ω to 30Ω (recommendation value 27Ω) Series resistor R_s .

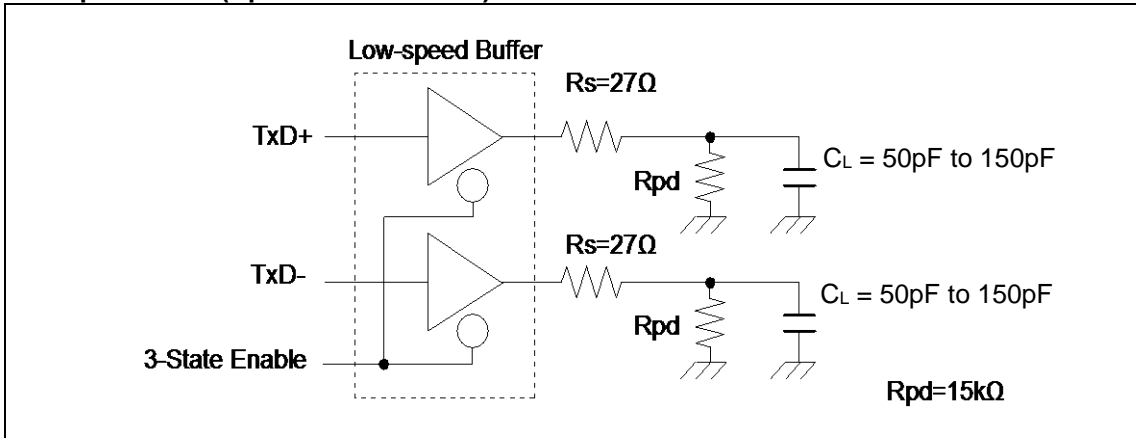

7: They indicate the rising time (T_{rise}) and falling time (T_{fall}) of the low-speed differential data signal. They are defined by the time between 10% and 90% of the output signal voltage.

12.9 Flash Memory Write/Erase Characteristics

12.9.1 Write / Erase time

(V_{CC} = 1.65V to 3.6V, T_A = - 40°C to + 85°C)

| Parameter | | Value | | Unit | Remarks |
|-------------------------------|--------------|-------|------|------|---|
| | | Typ* | Max* | | |
| Sector erase time | Large Sector | 1.1 | 2.7 | s | Includes write time prior to internal erase |
| | Small Sector | 0.3 | 0.9 | | |
| Half word (16-bit) write time | | 30 | 528 | μs | Not including system-level overhead time |
| Chip erase time | | 6.8 | 18 | s | Includes write time prior to internal erase |

*: The typical value is immediately after shipment, the maximum value is guarantee value under 10,000 cycle of erase/write.

12.9.2 Write cycles and data hold time

| Erase/write cycles (cycle) | Data hold time (year) | Remarks |
|----------------------------|-----------------------|---------|
| 1,000 | 20* | |
| 10,000 | 10* | |

*: At average + 85°C

12.10 Return Time from Low-Power Consumption Mode

12.10.1 Return Factor: Interrupt/WKUP

The return time from Low-Power consumption mode is indicated as follows. It is from receiving the return factor to starting the program operation.

Return Count Time

($V_{CC} = 1.65V$ to $3.6V$, $V_{DDI} = 1.1V$ to $1.3V$, $V_{SS} = 0V$, $T_A = -40^{\circ}C$ to $+85^{\circ}C$)

| Parameter | Symbol | Value | | Unit | Remarks |
|---|------------|------------|------|---------|-----------------|
| | | Typ | Max* | | |
| Sleep mode | t_{ICNT} | t_{CYCC} | | μs | |
| High-speed CR Timer mode, Main Timer mode, PLL Timer mode | | 40 | 80 | μs | |
| Low-speed CR Timer mode | | 350 | 700 | μs | |
| Sub Timer mode | | 690 | 880 | μs | |
| RTC mode, Stop mode | | 278 | 523 | μs | |
| Deep Standby RTC mode | | 318 | 603 | μs | When RAM is off |
| Deep Standby Stop mode | | 278 | 523 | μs | When RAM is on |

*: The maximum value depends on the accuracy of built-in CR.

Operation example of return from Low-Power consumption mode (by external interrupt*)

*: External interrupt is set to detecting fall edge.

Operation example of return from Low-Power consumption mode (by internal resource interrupt*)

*: Internal resource interrupt is not included in return factor by the kind of Low-Power consumption mode.

Notes:

- When interrupt recovers, the operation mode that CPU recovers depend on the state before the Low-Power consumption mode transition. See Chapter 6: Low Power Consumption Mode in FM3 Family Peripheral Manual.

12.10.2 Return Factor: Reset

The return time from Low-Power consumption mode is indicated as follows. It is from releasing reset to starting the program operation.

Return Count Time

($V_{CC} = 1.65V$ to $3.6V$, $V_{DDI} = 1.1V$ to $1.3V$, $V_{SS} = 0V$, $T_A = -40^{\circ}C$ to $+85^{\circ}C$)

| Parameter | Symbol | Value | | Unit | Remarks |
|---|------------|------------|------------|--------------------|-----------------------------------|
| | | Typ | Max* | | |
| Sleep mode | t_{RCNT} | 148 | 263 | μs | |
| High-speed CR Timer mode, Main Timer mode, PLL Timer mode | | 148 | 263 | μs | |
| Low-speed CR Timer mode | | 258 | 483 | μs | |
| Sub Timer mode | | 322 | 516 | μs | |
| RTC/Stop mode | | 278 | 523 | μs | |
| Deep Standby RTC mode Deep Standby Stop mode | | 318 278 | 603 523 | μs μs | When RAM is off When RAM is on |

*: The maximum value depends on the accuracy of built-in CR.

Operation example of return from Low-Power consumption mode (by INITX)

Operation example of return from low power consumption mode (by internal resource reset*)

*: Internal resource reset is not included in return factor by the kind of Low-Power consumption mode.

- Notes:**
- The return factor is different in each Low-Power consumption modes. See Chapter 6: Low Power Consumption Mode and Operations of Standby Modes in FM3 Family Peripheral Manual.
 - When interrupt recovers, the operation mode that CPU recovers depend on the state before the Low-Power consumption mode transition. See Chapter 6: Low Power Consumption Mode in FM3 Family Peripheral Manual.
 - The time during the power-on reset/low-voltage detection reset is excluded. See (6) Power-on Reset Timing in 4. AC Characteristics in Electrical Characteristics for the detail on the time during the power-on reset/low-voltage detection reset.
 - When in recovery from reset, CPU changes to the High-speed CR Run mode. When using the main clock or the PLL clock, it is necessary to add the main clock oscillation stabilization wait time or the Main PLL clock stabilization wait time.
 - The internal resource reset means the watchdog reset and the CSV reset.

NOTES

- ALL DIMENSIONS ARE IN MILLIMETERS.
- DATUM PLANE H IS LOCATED AT THE BOTTOM OF THE MOLD PARTING LINE COINCIDENT WITH WHERE THE LEAD EXITS THE BODY.
- DATUMS A-B AND D TO BE DETERMINED AT DATUM PLANE H.
- TO BE DETERMINED AT SEATING PLANE C.
- DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25mm PRE SIDE. DIMENSIONS D1 AND E1 INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE H.
- DETAILS OF PIN 1 IDENTIFIER ARE OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED.
- REGARDLESS OF THE RELATIVE SIZE OF THE UPPER AND LOWER BODY SECTIONS, DIMENSIONS D1 AND E1 ARE DETERMINED AT THE LARGEST FEATURE OF THE BODY EXCLUSIVE OF MOLD FLASH AND GATE BURRS. BUT INCLUDING ANY MISMATCH BETWEEN THE UPPER AND LOWER SECTIONS OF THE MOLDER BODY.
- DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. THE DAMBAR PROTRUSION (S) SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED b MAXIMUM BY MORE THAN 0.08mm. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE LEAD FOOT.
- THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10mm AND 0.25mm FROM THE LEAD TIP.
- A1 IS DEFINED AS THE DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT OF THE PACKAGE BODY.

1. FLASH lower bank read during write

■ PROBLEM DEFINITION

During writing (programming) to FLASH memory of an upper bank, FLASH memory of a lower bank could not be read at a specific timing in some operation combinations.

■ PARAMETERS AFFECTED

N/A

■ TRIGGER CONDITION(S)

This issue may happen when read data or fetch instruction from the FLASH memory lower bank (smaller sector), while a write (program) operation to the FLASH memory upper bank (larger sector) is in progress.

■ SCOPE OF IMPACT

Instructions could not be fetched (read) correctly from the lower bank, and then execution of the (corrupted) instructions may cause a hard fault or run-away. If an instruction in RAM reads a data from the lower bank while writing to the upper bank, an incorrect value might be read.

■ WORKAROUND

To rewrite the upper bank of FLASH memory, put the write instruction in RAM instead of the lower bank and execute it from the RAM. Do not access the lower bank until the write operation is completed (RDY=1). Especially to avoid a vector fetch from the lower bank of the FLASH memory by an interrupt occurred, the interrupt should be prohibited or the vector address should be set to RAM by the vector table offset register.

■ FIX STATUS

This issue was fixed in Rev. A.

2. FLASH Read during Write & Sector Erase Suspend

■ PROBLEM DEFINITION

When writing is executed during sector erase suspend, FLASH memory could not be read correctly at a specific timing.

■ PARAMETERS AFFECTED

N/A

■ TRIGGER CONDITION(S)

This issue may happen when read data or fetch instruction from the FLASH memory bank (higher or lower), while a write (program) operation is in progress to the opposite bank which has a sector erase suspended. The following flow could not be executed correctly.

- (a) Erase a sector of a bank
- (b) Suspend the sector erase operation
- (c) Write to a different sector of the bank
- (d) Execute an instruction or read data in the opposite bank

■ SCOPE OF IMPACT

- Instructions could not be fetched (read) correctly, and then execution of the (corrupted) instructions may cause a hard fault or run-away. If an instruction in RAM reads a data from the bank, an incorrect value might be read.

■ WORKAROUND

Do not execute the write operation to a different sector in the same bank at sector erase suspend.

■ FIX STATUS

This issue was fixed in Rev. A.

3. Regulator issue**■ PROBLEM DEFINITION**

The regulator does not get initialized while internal power-up sequence.

■ PARAMETERS AFFECTED

N/A

■ TRIGGER CONDITION(S)

This issue rarely happens depending on states of internal circuits which the user cannot control.

■ SCOPE OF IMPACT

MCU does not start operation if this issue occurs.

■ WORKAROUND

This error cannot be avoided by any software.

■ FIX STATUS

This issue was fixed in Rev. B.

4. HDMI-CEC arbitration lost issue**■ PROBLEM DEFINITION**

Large external load on CEC bus may cause arbitration lost.

■ PARAMETERS AFFECTED

N/A

■ TRIGGER CONDITION(S)

The arbitration lost detection mechanism samples outputting signals and determines that arbitration lost occurs if sampled signals do not match the outputting signals. The large external load on the CEC bus increases slew rate of the signals. The increased slew rate makes the mismatch between outputting signals and sampled signals and the mismatch misleads MCU that arbitration lost occurs.

■ SCOPE OF IMPACT

Once the arbitration lost is detected, the CEC aborts the transmission. Any transmission cannot be completed.

■ WORKAROUND

- This error cannot be avoided by any software. Reduce the external load.

■ FIX STATUS

- This issue was fixed in Rev. B.

5. HDMI-CEC polling message issue

■ PROBLEM DEFINITION

Error#1) While MCU sends a Polling Message, it always returns a NACK to a message coming to the MCU from another node.

Error#2) MCU always waits for 7-bit signal free on CEC line before it drives the line even when the last line initiator was another node.

■ PARAMETERS AFFECTED

N/A

■ TRIGGER CONDITION(S)

This error always happens.

■ SCOPE OF IMPACT

MCU does not reply properly to another node.

■ WORKAROUND

The software workaround is applied to Error #1.

1. Store 0x0 to SFREE register.
2. Monitor CEC line with GPIO and wait until 1 lasts for the signal free time.
3. Store frame data to TXDATA register and store 0x0F to RCADR1 or RCADR2 register.

It sends a message after 3~4 clocks of 32.768 kHz clock when TXDATA is stored 0x0F.

If the device receives a frame from another node within 2~3 clocks after storing TXDATA, the bus error occurs and if the device receives a frame from another node within 3~4 clocks after storing TXDATA, the arbitration lost occurs. In these cases:

4-A-1. Set RCADR1 or RCADR2 to former value from 0x0F to reply ACK

4-A-2. Return back to step 2 above

If the device receives a frame from another node within 1~2 clocks after storing TXDATA, take these steps.

4-B-1. Monitor CEC line with GPIO after 50us from storing TXDATA

4-B-2. Set TXEN to 1 -> 0 -> 1 immediately when GPIO finds state low on the CEC line

4-B-3. Set RCADR1 or RCADR2 to former value from 0x0F to reply ACK

4-B-4. Return back to step 2 above

For Error #2, there is no software workaround, but signal free time of fixed 7-bit does not violate HDMI-CEC specification. The specification says signal free time must be more than and equals to 5-bit.

■ FIX STATUS

The user uses the workaround to avoid the issue. The next silicon fixing the issue is not planned.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
