

# Low-Cost, High-Speed, Single-Supply Op Amps with Rail-to-Rail Outputs

## General Description

The MAX4012 single, MAX4016 dual, MAX4018 triple, and MAX4020 quad op amps are unity-gain-stable devices that combine high-speed performance with Rail-to-Rail outputs. The MAX4018 has a disable feature that reduces power-supply current to 400 $\mu$ A and places its outputs into a high-impedance state. These devices operate from a 3.3V to 10V single supply or from  $\pm 1.65$ V to  $\pm 5$ V dual supplies. The common-mode input voltage range extends beyond the negative power-supply rail (ground in single-supply applications).

These devices require only 5.5mA of quiescent supply current while achieving a 200MHz -3dB bandwidth and a 600V/ $\mu$ s slew rate. These parts are an excellent solution in low-power/low-voltage systems that require wide bandwidth, such as video, communications, and instrumentation. In addition, when disabled, their high-output impedance makes them ideal for multiplexing applications.

The MAX4012 comes in a miniature 5-pin SOT23 and 8-pin SO package, while the MAX4016 comes in 8-pin  $\mu$ MAX<sup>®</sup> and SO packages. The MAX4018/MAX4020 are available in a space-saving 16-pin QSOP, as well as a 14-pin SO.

## Applications

Set-Top Boxes  
Surveillance Video Systems  
Battery-Powered Instruments  
Video Line Driver  
Analog-to-Digital Converter Interface  
CCD Imaging Systems  
Video Routing and Switching Systems

## Typical Operating Circuit

$\mu$ MAX is a registered trademark of Maxim Integrated Products, Inc.

## Features

- ◆ **Low-Cost**
- ◆ **High Speed:**
  - 200MHz -3dB Bandwidth (MAX4012)
  - 150MHz -3dB Bandwidth (MAX4016/MAX4018/MAX4020)
  - 30MHz 0.1dB Gain Flatness
  - 600V/ $\mu$ s Slew Rate
- ◆ **Single 3.3V/5.0V Operation**
- ◆ **Rail-to-Rail Outputs**
- ◆ **Input Common-Mode Range Extends Beyond VEE**
- ◆ **Low Differential Gain/Phase: 0.02%/0.02°**
- ◆ **Low Distortion at 5MHz:**
  - 78dBc SFDR
  - 75dB Total Harmonic Distortion
- ◆ **High-Output Drive:  $\pm 120$ mA**
- ◆ **400 $\mu$ A Shutdown Capability (MAX4018)**
- ◆ **High-Output Impedance in Off State (MAX4018)**
- ◆ **Space-Saving SOT23, SO,  $\mu$ MAX, or QSOP Packages**

## Ordering Information

| PART         | TEMP RANGE     | PIN-PACKAGE | TOP MARK |
|--------------|----------------|-------------|----------|
| MAX4012EUK-T | -40°C to +85°C | 5 SOT23-5   | ABZP     |
| MAX4012ESA   | -40°C to +85°C | 8 SO        | —        |
| MAX4016ESA   | -40°C to +85°C | 8 SO        | —        |
| MAX4016EUA   | -40°C to +85°C | 8 $\mu$ MAX | —        |

Ordering Information continued at end of data sheet.

## Pin Configurations

# Low-Cost, High-Speed, Single-Supply Op Amps with Rail-to-Rail Outputs

## ABSOLUTE MAXIMUM RATINGS

|  |  |   |                 |
|--|--|---|-----------------|
| Supply Voltage (V <sub>CC</sub> to V <sub>EE</sub> )                   | 12V  | 8-Pin $\mu$ MAX (derate 4.1mW/°C above +70°C) | 330mW           |
| IN <sub>-</sub> , IN <sub>+</sub> , OUT <sub>-</sub> , EN <sub>-</sub> | (V <sub>EE</sub> - 0.3V) to (V <sub>CC</sub> + 0.3V) | 14-Pin SO (derate 8.3mW/°C above +70°C)       | 667mW           |
| Output Short-Circuit Duration to V <sub>CC</sub> or V <sub>EE</sub>    | Continuous   | 16-Pin QSOP (derate 8.3mW/°C above +70°C)     | 667mW           |
| Continuous Power Dissipation (T <sub>A</sub> = +70°C)                  |  | Operating Temperature Range                   | -40°C to +85°C  |
| 5-Pin SOT23 (derate 7.1mW/°C above +70°C)                              | 571mW  | Storage Temperature Range                     | -65°C to +150°C |
| 8-Pin SO (derate 5.9mW/°C above +70°C)                                 | 471mW  | Lead Temperature (soldering, 10s)             | +300°C          |

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or at any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## DC ELECTRICAL CHARACTERISTICS

(V<sub>CC</sub> = 5V, V<sub>EE</sub> = 0, EN<sub>-</sub> = 5V, R<sub>L</sub> =  $\infty$  to V<sub>CC</sub>/2, V<sub>OUT</sub> = V<sub>CC</sub>/2, T<sub>A</sub> = T<sub>MIN</sub> to T<sub>MAX</sub>, unless otherwise noted. Typical values are at T<sub>A</sub> = +25°C.) (Note 1)

MAX4012/MAX4016/MAX4018/MAX4020

# Low-Cost, High-Speed, Single-Supply Op Amps with Rail-to-Rail Outputs

## Detailed Description

The MAX4012/MAX4016/MAX4018/MAX4020 are single-supply, rail-to-rail, voltage-feedback amplifiers that employ current-feedback techniques to achieve 600V/μs slew rates and 200MHz bandwidths. Excellent harmonic distortion and differential gain/phase performance make these amplifiers an ideal choice for a wide variety of video and RF signal-processing applications.

The output voltage swing comes to within 50mV of each supply rail. Local feedback around the output stage assures low open-loop output impedance to reduce gain sensitivity to load variations. This feedback also produces demand-driven current bias to the output transistors for ±120mA drive capability, while constraining total supply current to less than 7mA. The input stage permits common-mode voltages beyond the negative supply and to within 2.25V of the positive supply rail.

## Applications Information

### Choosing Resistor Values

#### Unity-Gain Configuration

The MAX4012/MAX4016/MAX4018/MAX4020 are internally compensated for unity gain. When configured for unity gain, the devices require a 24Ω resistor (R<sub>F</sub>) in series with the feedback path. This resistor improves AC response by reducing the Q of the parallel LC circuit

formed by the parasitic feedback capacitance and inductance.

#### Inverting and Noninverting Configurations

Select the gain-setting feedback (R<sub>F</sub>) and input (R<sub>G</sub>) resistor values to fit your application. Large resistor values increase voltage noise and interact with the amplifier's input and PC board capacitance. This can generate undesirable poles and zeros and decrease bandwidth or cause oscillations. For example, a noninverting gain-of-two configuration (R<sub>F</sub> = R<sub>G</sub>) using 1kΩ resistors, combined with 1pF of amplifier input capacitance and 1pF of PC board capacitance, causes a pole at 159MHz. Since this pole is within the amplifier bandwidth, it jeopardizes stability. Reducing the 1kΩ resistors to 100Ω extends the pole frequency to 1.59GHz, but could limit output swing by adding 200Ω in parallel with the amplifier's load resistor. Table 1 shows suggested feedback, gain resistors, and bandwidth for several gain values in the configurations shown in Figures 1a and 1b.

#### Layout and Power-Supply Bypassing

These amplifiers operate from a single 3.3V to 11V power supply or from dual supplies to ±5.5V. For single-supply operation, bypass V<sub>CC</sub> to ground with a 0.1μF capacitor as close to the pin as possible. If operating with dual supplies, bypass each supply with a 0.1μF capacitor.

Figure 1a. Noninverting Gain Configuration

Figure 1b. Inverting Gain Configuration

# Low-Cost, High-Speed, Single-Supply Op Amps with Rail-to-Rail Outputs

MAX4012/MAX4016/MAX4018/MAX4020

Maxim recommends using microstrip and stripline techniques to obtain full bandwidth. To ensure that the PC board does not degrade the amplifier's performance, design it for a frequency greater than 1GHz. Pay careful attention to inputs and outputs to avoid large parasitic capacitance. Whether or not you use a constant-impedance board, observe the following guidelines when designing the board:

- Don't use wire-wrap boards because they are too inductive.
- Don't use IC sockets because they increase parasitic capacitance and inductance.
- Use surface-mount instead of through-hole components for better high-frequency performance.
- Use a PC board with at least two layers; it should be as free from voids as possible.
- Keep signal lines as short and as straight as possible. Do not make 90° turns; round all corners.

## Rail-to-Rail Outputs, Ground-Sensing Input

The input common-mode range extends from ( $V_{EE} - 200\text{mV}$ ) to ( $V_{CC} - 2.25\text{V}$ ) with excellent common-mode rejection. Beyond this range, the amplifier output is a nonlinear function of the input, but does not undergo phase reversal or latchup.

The output swings to within 60mV of either power-supply rail with a  $2\text{k}\Omega$  load. The input ground-sensing and the rail-to-rail output substantially increase the dynamic range. With a symmetric input in a single 5V application, the input can swing  $2.95\text{V}_{\text{P-P}}$ , and the output can swing  $4.9\text{V}_{\text{P-P}}$  with minimal distortion.

## Enable Input and Disabled Output

The enable feature ( $\text{EN}_-$ ) allows the amplifier to be placed in a low-power, high-output-impedance state. Typically, the  $\text{EN}_-$  logic low input current ( $I_{\text{IL}}$ ) is small. However, as the  $\text{EN}_-$  voltage ( $V_{\text{IL}}$ ) approaches the negative supply rail,  $I_{\text{IL}}$  increases (Figure 2). A single resistor connected as shown in Figure 3 prevents the rise in the logic-low input current. This resistor provides a feedback mechanism that increases  $V_{\text{IL}}$  as the logic input is brought to  $V_{\text{EE}}$ . Figure 4 shows the resulting input current ( $I_{\text{IL}}$ ).

When the MAX4018 is disabled, the amplifier's output impedance is  $35\text{k}\Omega$ . This high resistance and the low 2pF output capacitance make this part ideal in RF/video multiplexer or switch applications. For larger arrays, pay careful attention to capacitive loading. See the *Output Capacitive Loading and Stability* section for more information.

**Table 1. Recommended Component Values**

| COMPONENT                         | GAIN (V/V) |      |      |      |      |      |      |          |      |          |
|-----------------------------------|------------|------|------|------|------|------|------|----------|------|----------|
|                                   | +1         | -1   | +2   | -2   | +5   | -5   | +10  | -10      | +25  | -25      |

| $R_{\text{G}} (\Omega)$           | $\infty$   | 500  | 500  | 250  | 124  | 100  | 56   | 50       | 20   | 50       |
| $R_{\text{S}} (\Omega)$           | —          | 0    | —    | 0    | —    | 0    | —    | 0        | —    | 0        |
| $R_{\text{TIN}} (\Omega)$         | 49.9       | 56   | 49.9 | 62   | 49.9 | 100  | 49.9 | $\infty$ | 49.9 | $\infty$ |
| $R_{\text{TO}} (\Omega)$          | 49.9       | 49.9 | 49.9 | 49.9 | 49.9 | 49.9 | 49.9 | 49.9     | 49.9 | 49.9     |
| Small-Signal -3dB Bandwidth (MHz) | 200        | 90   | 105  | 60   | 25   | 33   | 11   | 25       | 6    | 10       |

**Note:**  $R_{\text{L}} = R_{\text{O}} + R_{\text{TO}}$ ;  $R_{\text{TIN}}$  and  $R_{\text{TO}}$  are calculated for  $50\Omega$  applications. For  $75\Omega$  systems,  $R_{\text{TO}} = 75\Omega$ ; calculate  $R_{\text{TIN}}$  from the following equation:

$$R_{\text{TIN}} = \frac{75}{1 - \frac{75}{R_{\text{G}}}} \Omega$$

# Low-Cost, High-Speed, Single-Supply Op Amps with Rail-to-Rail Outputs

Figure 2. Enable Logic-Low Input Current vs.  $V_{IL}$

Figure 4. Enable Logic-Low Input Current vs.  $V_{IL}$  with 10k $\Omega$  Series Resistor

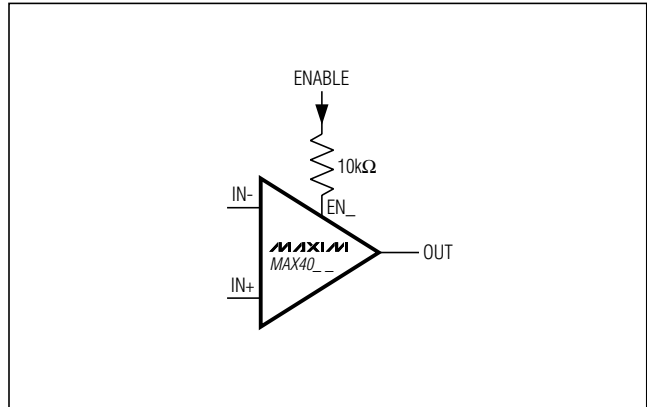

Figure 3. Circuit to Reduce Enable Logic-Low Input Current

To implement the mux function, the outputs of multiple amplifiers can be tied together, and only the amplifier with the selected input will be enabled. All of the other amplifiers will be placed in the low-power shutdown mode, with their high output impedance presenting very little load to the active amplifier output. For gains of +2 or greater, the feedback network impedance of all the amplifiers used in a mux application must be considered when calculating the total load on the active amplifier output.

### Output Capacitive Loading and Stability

The MAX4012/MAX4016/MAX4018/MAX4020 are optimized for AC performance. They are not designed to drive highly reactive loads, which decreases phase margin and may produce excessive ringing and oscillation. Figure 5 shows a circuit that eliminates this problem. Figure 6 is a graph of the optimal isolation resistor ( $R_S$ ) vs. capacitive load. Figure 7 shows how a capacitive load causes excessive peaking of the amplifier's frequency response if the capacitor is not isolated from the amplifier by a resistor. A small isolation resistor (usually 20 $\Omega$  to 30 $\Omega$ ) placed before the reactive load prevents ringing and oscillation. At higher capacitive loads, AC performance is controlled by the interaction of the load capacitance and the isolation resistor. Figure 8 shows the effect of a 27 $\Omega$  isolation resistor on closed-loop response.

Coaxial cable and other transmission lines are easily driven when properly terminated at both ends with their characteristic impedance. Driving back-terminated transmission lines essentially eliminates the line's capacitance.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
