# **PI7C9X2G303EL** PCI EXPRESS GEN 2 PACKET SWITCH **3-Port, 3-Lane, ExtremeLo PCIe 2.0 Packet Switch**

DATASHEET REVISION 2-2 August 2017

1545 Barber Lane Milpitas, CA 95035 Telephone: 408-232-9100 FAX: 408-434-1040 Internet: http://www.diodes.com

#### IMPORTANT NOTICE

DIODES INCORPORATED MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARDS TO THIS DOCUMENT, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION).

Diodes Incorporated and its subsidiaries reserve the right to make modifications, enhancements, improvements, corrections or other changes without further notice to this document and any product described herein. Diodes Incorporated does not assume any liability arising out of the application or use of this document or any product described herein; neither does Diodes Incorporated convey any license under its patent or trademark rights, nor the rights of others. Any Customer or user of this document or products described herein in such applications shall assume all risks of such use and will agree to hold Diodes Incorporated and all the companies whose products are represented on Diodes Incorporated w ebsite, harmless against all damages.

Diodes Incorporated does not warrant or accept any liability whatsoever in respect of any products purchased through unauthorized sales channel.

Should Customers purchase or use Diodes Incorporated products for any unintended or unauthorized application, Customers shall indemnify and hold Diodes Incorporated and its representatives harmless against all claims, damages, expenses, and attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized application.

Products described herein may be covered by one or more United States, international or foreign patents pending. Product names and markings noted herein may also be covered by one or more United States, international or foreign trademarks.

This document is written in English but may be translated into multiple languages for reference. Only the English version of this document is the final and determinative format released by Diodes Incorporated.

#### LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or

2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the

failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notw ithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products or systems.

# **REVISION HISTORY**

| Date     | <b>Revision Number</b> | Description  |
|----------|------------------------|--|
| 7/13/11  | 0.1                    | Preliminary Datasheet  |
| 9/13/11  | 0.2                    | Updated Section 3.3 Miscellaneous Signals (GPIO[2] and GPIO[3])                              |
|          |                        | Updated Section 4.1 Pin List (GPIO[2] and GPIO[3])   |
| 11/23/11 | 0.3                    | Updated Section 1 Features (integrated reference clock)                                      |
|          |                        | Updated Section 3.1 PCI Express Interface Signals (Added REFCLKI P, REFCLKI N,               |
|          |                        | REFCLKO_P[2:0], REFCLKO_N[2:0], and IREF)  |
| 8/10/12  | 1.0                    | Updated Section 1 Features (OBFF and LTR support)  |
|          |                        | Updated Section 3 Pin Description (VDDC, VDDCAUX, and AVDD)                                  |
|          |                        | Updated Section 6 EEPROM Interface And System Management Bus                                 |
|          |                        | Updated Section 7 Register Description   |
| 11/22/12 | 1.1                    | Updated Section 3.3 Miscellaneous Signals (NC and Test)                                      |
|          |                        | Updated Section 4.1 Pin List   |
|          |                        | Updated Figure 12 1 Package outline drawing  |
|          |                        | Updated Table 8-1 Clock Requirement  |
| 1/2/13   | 1.2                    | Updated Section 3 Pin Description (PWR SAV, TCK, TRST L, and NC)                             |
|          |                        | Added Section 11.4 AC Switching Characteristics of Clock Buffer                              |
|          |                        | Updated Section 4.1 Pin List   |
| 7/15/14  | 1.3                    | Updated Section 1 (512-byte maximum payload size support, No-blocking capability)            |
|          |                        | Updated Section 3 (Removed internal resistance for DWNRST_L[2:1], CLKBUF_PD,                 |
|          |                        | VC1_EN, RXPOLINV_DIS, PL_512B, PRSNT[2:1], SLOTCLK, SLOT_IMP[2:1],                           |
|          |                        | EEPD, SMBCLK, SMBDATA, SCAN_EN, GPIO[7:0], PWR_SAV, TMS, TDI, and                            |
|          |                        | TRST_L)  |
|          |                        | Updated Section 3.2 Port Configuration Signals   |
|          |                        | Updated Section 3.3 Miscellaneous Signals  |
|          |                        | Updated Section 4.1 Pin List Of 136-Pin QFN  |
|          |                        | Updated Section 5.1 Physical Layer Circuit   |
|          |                        | Updated Section 5.1.7 Drive De-Emphasis  |
|          |                        | Updated Section 7.2.75 Device Capabilities Register (Max_Payload_Size Supported)             |
|          |                        | Updated Section 13 Ordering Information  |
|          |                        | Updated Table 11-2 DC Electrical Characteristics   |
| 11/17/14 |                        | Updated Figure 12-2 Package Bottom View  |
| 11/17/14 | 1.4                    | Updated Section 7.2 Transparent Mode Configuration Registers                                 |
| 07/16/15 | 1.5                    | Updated Section 8 Clock Scheme   |
| 07/16/15 | 1.5                    | Updated Section 3.1 PCI Express Interface Signals  |
|          |                        | Updated Section 3.2 Port Configuration Signals<br>Updated Section 5.1 Physical Layer Circuit |
|          |                        | Updated Section 5.1 EEPROM Interface   |
|          |                        | Updated Section 7.2 Transparent Mode Configuration Registers                                 |
|          |                        | Updated Section 7.2 Transparent Wold Comparation Registers                                   |
|          |                        | Updated Table 9-1 Instruction Register Codes   |
|          |                        | Updated Table 9-2 JTAG Device ID Register  |
|          |                        | Updated Table 9-3 JTAG Boundary Scan Register Definition                                     |
|          |                        | Updated Table 11-2 DC Electrical Characteristics   |
| 09/07/15 | 1.6                    | Updated Table 11-1 Absolute maximum ratings  |
| 12/23/15 | 1.7                    | Updated Section 3.1 PIN Description  |
| 12/23/13 | 1./                    | Updated Table 11-1 Absolute Maximum Ratings  |
|          |                        | Updated Table 11-2 DC Electrical Characteristics   |
| 02/26/16 | 1.8                    | Added Section 11 Power Sequence  |
| 02/20/10 | 1.0                    | Audeu Section 1110Wei Sequence   |

# **1 FEATURES**

- 3-lane PCI Express Gen 2 Switch with 3 PCI Express ports
- Supports "Cut-through" (Default) as well as "Store and Forward" mode for packet switching
- Peer-to-peer switching between any two downstream ports
- 150 ns typical latency for packet routed through Switch without blocking
- Integrated reference clock for downstream ports
- Strapped pins configurable with optional EEPROM or SMBus
- SMBus interface support
- Compliant with System Management (SM) Bus, Version 1.0
- Compliant with PCI Express Base Specification Revision 2.1
- Compliant with PCI Express CEM Specification Revision 2.0
- Compliant with PCI-to-PCI Bridge Architecture Specification Revision 1.2
- Compliant with Advanced Configuration Power Interface (ACPI) Specification
- Reliability, Availability and Serviceability
  - Supports Data Poisoning and End-to-End CRC
  - Advanced Error Reporting and Logging
  - IEEE 1149.1 JTAG interface support
- Advanced Power Saving
  - Empty downstream ports are set to idle state to minimize power consumption
- Link Power Management
  - Supports L0, L0s, L1, L2, L2/L3<sub>Ready</sub> and L3 link power states
  - Active state power management for L0s and L1 states
- Device State Power Management
  - Supports D0, D3<sub>Hot</sub> and D3<sub>Cold</sub> device power states
  - 3.3V Aux Power support in D3<sub>Cold</sub> power state
- Port Arbitration: Round Robin (RR), Weighted RR and Time-based Weighted RR
- Extended Virtual Channel capability
  - Two Virtual Channels (VC) and Eight Traffic Class (TC) support
  - Disabled VCs' buffer is assigned to enabled VCs for resource sharing
  - Independent TC/VC mapping for each port
  - Provides VC arbitration selections: Strict Priority, Round Robin (RR) and Programmable Weighted RR
- Supports Isochronous Traffic
  - Isochronous traffic class mapped to VC1 only
  - Strict time based credit policing
- Supports up to 512-byte maximum payload size
- Programmable driver current and de-emphasis level at each individual port
- Support Access Control Service (ACS) for peer-to-peer traffic
- Support Address Translation (AT) packet for SR-IOV application
- Support OBFF and LTR
- Low Power Dissipation: 650 mW typical in L0 normal mode
- Industrial Temperature Range -40° to 85°C
- 136-pin aQFN 8mm x 8mm package

# 2 GENERAL DESCRIPTION

Similar to the role of PCI/PCIX Bridge in PCI/PCIX bus architecture, the function of PCI Express (PCIE) Switch is to expand the connectivity to allow more end devices to be reached by host controllers in PCIE serial interconnect architecture. The 3-lane PCIe Switch is in 3-port type configuration. It provides users the flexibility to expand or fan-out the PCI Express lanes based on their application needs.

In the PCI Express Architecture, the PCIE Switch forwards posted and non-posted requests, and completion packets in either downstream or upstream direction concurrently as if a virtual PCI Bridge is in operation on each port. By visualizing the port as a virtual Bridge, the Switch can be logically viewed as two-level cascaded multiple virtual PCI-to-PCI Bridges, where one upstream-port Bridge sits on all downstream-port Bridges. Similar to a PCI Bridge during enumeration, each port is given a unique bus number, device number, and function number by the initiating software. The bus number, device number, and function number are combined to form a destination ID for each specific port. In addition to that, the memory-map and IO address ranges are exclusively allocated to each port as well. After the software enumeration is finished, the packets are routed to the dedicated port based on the embedded address or destination ID. To ensure the packet integrity during forwarding, the Switch is not allowed to split the packets to multiple small packets or merge the received packets into a large transmit packet. Also, the IDs of the requesters and completers are kept unchanged along the path between ingress and egress port.

The Switch employs the architecture of Combined Input and Output Queue (CIOQ) in implementation. The main reason for choosing CIOQ is that the required memory bandwidth of input queue equals to the bandwidth of ingress port rather than increasing proportionally with port numbers as an output queue Switch does. The CIOQ at each ingress port contains separate dedicated queues to store packets. The packets are arbitrated to the egress port based on the PCIe transaction-ordering rule. For the packets without ordering information, they are permitted to pass over each other in case that the addressed egress port is available to accept them. As to the packets required to follow the ordering rule, the Head-Of-Line (HOL) issue becomes unavoidable for packets destined to different egress ports since the operation of producer-consumer model has to be retained; otherwise the system might occur hang-up problem. On the other hand, the Switch places replay buffer at each egress port to defer the packets before sending it out. This can assure the maximum throughput being achieved and therefore the Switch works efficiently. Another advantage of implementing CIOQ in PCIe Switch is that the credit announcement to the counterpart is simplified and streamlined because of the credit-based flow control protocol. The protocol requires that each ingress port maintains the credits independently without checking other ports' credit availability, which is otherwise required by pure output queue architecture.

The Switch supports two virtual channels (VC0, VC1) and eight traffic classes (TC0  $\sim$  TC7) at each port. The ingress port independently assigns packets into the preferred virtual channel while the egress port outputs the packet based on the predefined port and VC arbitration algorithm. For instance, the isochronous packet is given a special traffic class number other than TC0 and mapped into VC1 accordingly. By employing the strict time based credit policy for port arbitration and assigning higher priority to VC1 than VC0, the Switch can therefore guarantee the time-sensitive packet is not blocked by regular traffic to assure the quality of service. In addition, some datacentric applications only carry TC0/VC0 traffic. As a result, there are no packets that would consume VC1 bandwidth. In order to improve the efficiency of buffer usage, the unused VC1 queues can be reassigned to VC0 and enable each of the ingress ports to handle more data traffic bursts. This virtual channel resource relocation feature enhances the performance of the PCIe Switch further.

The Switch provides the advanced feature of Access Control Service (ACS). This feature regulates which components are allowed to communicate with each other within the PCIe multiple-point fabric, and allows the system to have more control over packet routing in the Switch. As a result, peer-to-peer traffic can be facilitated more accurately and efficiently. When the system also implements Address Translation Service (ATS), the peer-to-peer requests with translated address can be routed directly by enabling the corresponding option in ACS to avoid possible performance bottleneck associated with re-direction, which introduces extra latency and may increase link and RC congestion.

The built-in Integrated Reference Clock Buffer of the PCI Express Switch supports three reference clock outputs. The clock buffer is from a single 100M Hz clock input, and distributes the clock source to three outputs, which can be used by the downstream PCI Express end devices. The clock buffer feature can be enabled and disabled by strapping pin setting.

# **3 PIN DESCRIPTION**

# 3.1 PCI EXPRESS INTERFACE SIGNALS

| NAME           | PIN               | TYPE | DESCRIPTION  |
|----------------|-------------------|------|--|
| REFCLKP        | A24               | Ι    | <b>Reference Clock In put Pair:</b> Connect to 100MHz differential clock   |
| REFCLKN        | A22               |      | when integrated reference clock buffer is disabled (CLKBUF_PD=1),<br>or connect to one of the Integrated Reference Clock Output Pairs    |
|                |                   |      | (REFCLKO_P and REFCLKO_N) of this Switch when integrated   |
|                |                   |      | reference clock buffer is enabled (CLKBUF_PD=0).   |
|                |                   |      | The input clock signals must be delivered to the clock buffer cell   |
|                |                   |      | through an AC-coupled interface so that only the AC information of   |
|                |                   |      | the clock is received, converted, and buffered. It is recommended that a 0.1 uF be used in the AC-coupling.                              |
| PERP[2:0]      | A28, C33, C9      | Ι    | PCI Express Data Serial Input Pairs: Differential data receive   |
|                |                   |      | signals in three ports.  |
| PERN[2:0]      | A26, C31,         | I    | Port 0 (Upstream Port) is PERP[0] and PERN[0]  |
| TERN[2.0]      | C11               | 1    | Port 1 (Downstream Port) is PERP[1] and PERN[1]  |
|                |                   |      | Port 2 (Downstream Port) is PERP[2] and PERN[2]  |
| PETP[2:0]      | C25, C29,         | 0    | PCI Express Data Serial Output Pairs: Differential data transmit   |
|                | A10               |      | signals in three ports.  |
|                |                   |      | Port 0 (Upstream Port) is PETP[0] and PETN[0]  |
|                |                   |      | Port 1 (Downstream Port) is PETP[1] and PETN[1]  |
| PETN[2:0]      | C23, C27,<br>A12  | 0    | Port 2 (Downstream Port) is PETP[2] and PETN[2]  |
|                | A12               |      |  |
|                |                   |      |  |
| PERST L        | M1                | Ι    | System Reset (Active LOW): When PERST L is asserted, the   |
| _              |                   |      | internal states of whole chip except sticky logics are initialized.  |
|                |                   |      | Please refer to Table 11-2 for PERST L spec.   |
| DWNRST_L[2:1]  | J3, F1            | 0    | <b>Downstream Device Reset (Active LOW):</b> DWNRST_L provides a   |
|                |                   |      | reset signal to the devices connected to the downstream ports of the   |
|                |                   |      | switch. The signal is active when either PERST_L is asserted or the device is just plugged into the switch. DWNRST_L [x] corresponds to  |
|                |                   |      | Portx, where $x=1,2,3$ .   |
| REXT           | A18               | Ι    | <b>External Reference Resistor:</b> Connect an external resistor (1.43K  |
|                |                   |      | Ohm +/- 1%) to REXT_GND to provide a reference to both the bias currents and impedance calibration circuitry.                            |
| REXT_GND       | C15               | Ι    | External Reference Resistor Ground: Connect to an external resistor  |
| REFCLKI P,     | AE35, AH37        | Ι    | to REXT. Integrated Reference Clock Input Pair: Connect to external  |
| REFCLKI_F,     | AL55, All57       | 1    | 100MHz differential clock for the integrated reference clock buffer.   |
| REFCLKO_P[2:0] | AB37, V37,        | 0    | Integrated Reference Clock Output Pairs: 100MHz external   |
| REFCLKO_N[2:0] | P37<br>AD37, Y37, | 0    | differential HCSL clock outputs for the integrated reference clock buffer.   |
| KETCEKO_N[2.0] | T37               | 0    |  |
| IREF           | R35               | Ι    | Differential Reference Clock Output Current Resistor: External   |
|                |                   |      | resistor (475 Ohm +/- 1%) connection to set the differential reference clock output current.   |
| CLKBUF_PD      | AR29              | Ι    | Reference Clock Output Pairs Power Down: When CLKBUF_PD is   |
|                |                   |      | asserted high, the integrated reference clock buffer and Reference   |
|                |                   |      | Clock Outputs are disabled. When it is asserted low, the integrated reference clock buffer and Reference Clock Outputs are enabled. This |
|                |                   |      | pin has internal pull-down. If no board trace is connected to this pin,  |
|                |                   |      | the internal pull-down resistor of this pin is enough. However, if pin is  |
|                |                   |      | connected to a board trace and not driven, it is recommended that an   |
|                |                   |      | external 330-ohm pull-down resistor be used.   |

# 3.2 PORT CONFIGURATION SIGNALS

| NAME              | PIN                    | TYPE | DESCRIPTION  |
|-------------------|------------------------|------|--|
| VC1_EN            | W3                     | Ι    | Virtual Channel 1 Resource Sharing Enable: The chip provides the capability to support virtual channel 1 (VC1), in addition to the standard virtual channel 0. When this pin is asserted high, Virtual Channel 1 is enabled, and virtual channel resource sharing is not available. When it is asserted low, the chip would allocate the additional VC1 resource to VC0, and VC1 capability is disabled. This pin has internal pull-down resistor. If no board trace is connected to this pin, the internal pull-down resistor of this pin is enough. However, if pin is connected to a board trace and not driven, it is recommended that an external 330-ohm pull-down resistor be used. |
| RXPOLINV_DIS      | AE3                    | Ι    | <b>Rx Polarity Inversion Disable:</b> When RXPOLINV_DIS is asserted high, it indicates to disable Rx Polarity Inversion detection function. Otherwise, it indicates to enable Rx Polarity Inversion detection function. This pin has internal pull-down resistor. If no board trace is connected to this pin, the internal pull-down resistor of this pin is enough. However, if pin is connected to a board trace and not driven, it is recommended that an external 330-ohm pull-down resistor be used.  |
| PL_512B           | AR23                   | Ι    | <b>Max. Payload Size 512B:</b> When PL 512B is asserted high, it indicates the max. payload size capability is 512B. Otherwise, it indicates the max. Payload size is 256B. This pin has internal pull-down resistor. If no board trace is connected to this pin, the internal pull-down resistor of this pin is enough. However, if pin is connected to a board trace and not driven, it is recommended that an external 330-ohm pull-down resistor be used.  |
| PRSNT[2:1]        | AA3, Y1                | Ι    | <b>Present:</b> When PRSNT is asserted low, it indicates that the device is present in the slot of downstream port. Otherwise, it indicates the absence of the device. PRSNT [x] is correspondent to Port x, where x=1,2,3. These pins have internal pull-down resistors.  |
| SLOTCLK           | AR7                    | Ι    | Slot Clock Configuration: It determines if the downstream component<br>uses the same physical reference clock that the platform provides on the<br>connector. When SLOTCLK is high, the platform reference clock is<br>employed. By default, all downstream ports use the same physical<br>reference clock provided by platform. This pin has internal pull-down<br>resistor. If no board trace is connected to this pin, the internal pull-down<br>resistor of this pin is enough. However, if pin is connected to a board trace<br>and not driven, it is recommended that an external 330-ohm pull-down<br>resistor be used.   |
| SLOT_IMP[2:1]     | AU16, AR15             | Ι    | <b>Slot Implemented:</b> These signals are asserted to indicate that the downstream ports are connected to slots. $SLOT_IMP[x]$ corresponds to Portx, where $x=1,2,3$ . When $SLOT_IMP[x]$ is asserted, the Portx is connected to slot. Otherwise, it is chip-to-chip connection directly. These pins have internal pull-down resistors. If no board trace is connected to these pins, the internal pull-down resistors of these pins are enough. However, if pins are connected to a board trace and not driven, it is recommended that external 330-ohm pull-down resistors be used.   |
| PORT ST ATUS[2:0] | AM37,<br>AL35,<br>AP37 | 0    | <b>Port Status:</b> These signals indicate the status of each port. Please connect to pin header for debug used.<br>PORT ST ATUS[x] is correspondent to Port x, where x=0, 1, 2.   |

# 3.3 MISCELLANEOUS SIGNALS

| NAME    | PIN  | TYPE | DESCRIPTION   |
|---------|------|------|---|
| EECLK   | AJ35 | 0    | <b>EEPROM Clock:</b> Clock signal to the EEPROM interface.                |
| EEPD    | AK37 | I/O  | <b>EEPRO M Data:</b> Bi-directional serial data interface to and from the |
|         |      |      | EEPROM. The pin is set to '1' by default.                                 |
| SMBCLK  | AH1  | Ι    | SM Bus Clock: System management Bus Clock. This pin requires an           |
|         |      |      | external 5.1K-ohm pull-up resistor.                                       |
| SMBDATA | AK1  | I/O  | SM Bus Data: Bi-Directional System Management Bus Data. This pin          |
|         |      |      | requires an external 5.1K-ohm pull-up resistor.                           |

| NAME           | PIN                        | TYPE | DESCRIPTION  |
|----------------|----------------------------|------|--|
| SCAN_EN        | AG35                       | I/O  | Full-Scan Enable Control: For normal operation, SCAN_EN is an output   |
|                |                            |      | with a value of "0". SCAN_EN becomes an input during manufacturing   |
|                |                            |      | testing.   |
| GPIO[7:0]      | AU14, AR13,                | I/O  | General Purpose Input and Output: These eight general-purpose pins are   |
|                | AU12, AU10,                |      | programmed as either input-only or bi-directional pins by writing the GPIO   |
|                | AR11, AU8,                 |      | output enable control register.  |
|                | AU6, AR9                   |      | When SMBus is implemented, GPIO[7:5] act as the SMBus address pins, which set Bit 2 to 0 of the SMBus address.   |
|                |                            |      | which set Bit 2 to 0 of the SiviBus address.   |
|                |                            |      | <b>Debug Mode Selection:</b> In debug mode, GPIO[4:0] are used for Debug   |

# 5 FUNCTIONAL DESCRIPTION

Multiple virtual PCI-to-PCI Bridges (VPPB), connected by a virtual PCI bus, reside in the Switch. Each VPPB contains the complete PCIe architecture layers that consist of the physical, data link, and transaction layer. The packets entering the Switch via one of VPPBs are first converted from serial bit-stream into parallel bus signals in physical layer, stripped off the link-related header by data link layer, and then relayed up to the transaction layer to extract out the transaction header. According to the address or ID embedded in the transaction header, the entire transaction packets are forwarded to the destination VPPB for formatting as a serial-type PCIe packet through the transmit circuits in the data link layer and physical layer. The following sections describe these function elements for processing PCIe packets within the Switch.

# 5.1 PHYSICAL LAYER CIRCUIT

The physical layer circuit design is based on the PHY Interface for PCI Express Architecture (PIPE). It contains Physical Media Attachment (PMA) and Physical Coding Sub-layer (PCS) blocks. PMA includes Serializer/ Deserializer (SERDES), PLL<sup>1</sup>, Clock Recovery module, receiver detection circuits, beacon transmitter, electrical idle detector, and input/output buffers. PCS consists of framer, 8B/10B encoder/decoder, receiver elastic buffer, and PIPE PHY control/status circuitries. To provide the flexibility for port configuration, each lane has its own control and status signals for MAC to access individually. In addition, a pair of PRBS generator and checker is included for PHY built-in self test. The main functions of physical layer circuits include the conversion between serial-link and parallel bus, provision of clock source for the Switch, resolving clock difference in receiver end, and detection of physical layer errors.

In order to meet the needs of different application, the drive amplitude, de-emphasis and equalization of each transmitting channels can be adjusted using EEPROM individually. De-emphasis of -3.5 db is implemented by the transmitters when full swing signaling is used, while an offset can be individually applied to each channel.

## 5.1.1 RECEIVER DETECTION

The physical layer circuits implement receiver detection, which detects the presence of an attached 50 ohm to ground termination as per PCI Express Specification. The detect circuits determine if the voltage levels of the receiver have crossed the internal threshold after a configurable time determined by the Receiver Detection Threshold field in the PHY Parameter 2 Register (offset 7Ch, bit[6:4]) as listed in Table 5-1, which can be configured by EEPROM or SMBUS settings.

| Receiver Detection<br>Threshold | Threshold            |
|---------------------------------|----------------------|
| 000                             | 1.0 us               |
| 001                             | 2.0 us               |
| 010                             | 4.0 us (Recommended) |
| 011                             | 5.0 us               |
| 100                             | 10 us                |
| 101                             | 20 us                |
| 110                             | 40 us                |
| 111                             | 50 us                |

#### **Table 5-1 Receiver Detection Threshold Settings**

<sup>&</sup>lt;sup>1</sup> Multiple lanes could share the PLL.

# 5.1.2 RECEIVER SIGNAL DETECTION

Receiver signal idling is detected with levels above a programmable threshold specified by Receiver Signal Detect field in the PHY Parameter 2 Register (Offset 7Ch, bit[21:20]) as listed in Table 5-2, which can be configured on a per-port basis via EEPROM or SMBUS settings.

#### Table 5-2 Receiver Signal Detect Threshold

| <b>Receiver Signal Detect</b> | Min (mV ppd) | Max (mV ppd) |
|-------------------------------|--------------|--------------|
| 00                            | 50           | 80           |
| 01 (Recommended)              | 65           | 175          |
| 10                            | 75           | 200          |
| 11                            | 120          | 240          |

## 5.1.3 RECEIVER EQUALIZATION

The receiver implements programmable equalizer via the Receiver Equalization field in the PHY Parameter 2 Register (Offset 7Ch, bit[25:22]) as listed in Table 5-3, which can be configured on a per-port basis via EEPROM or SMBUS settings.

#### Table 5-3 Receiver Equalization Settings

| Receiver Equalization | Equalization |
|-----------------------|--------------|
| 0000                  | Off          |
| 0010                  | Low          |
| 0110 (Recommended)    | Medium       |
| 1110                  | High         |

## 5.1.4 TRANSMITTER SWING

The PCI Express transmitters support implementations of both full voltage swing and half (low) voltage swing. In full swing signaling mode, the transmitters implement de-emphasis, while in half swing mode, the transmitters do not. The Transmitter Swing field in the PHY Parameter 2 Register (offset 7Ch, Bit[30]) is used for the selection of full swing signaling or half swing signaling, which can be configured on a per-port basis via EEPROM or SMBUS settings.

| Table | 5-4 | <b>Transmitter</b> | Swing | Settings |
|-------|-----|--------------------|-------|----------|
|-------|-----|--------------------|-------|----------|

| Transmitter Swing | Mode               | De-emphasis     |
|-------------------|--------------------|-----------------|
| 0                 | Full Voltage Swing | Implemented     |
| 1                 | Half Voltage Swing | Not implemented |

### 5.1.5 DRIVE AMPLITUDE AND DE-EMPHASIS SETTINGS

Depending on the operation condition (voltage swing and de-emphasis condition), one of the Drive A mplitude Base Level fields in the Switch Operation Mode Register (offset 74h) and one of the Drive De-Emphasis Base Level fields in the PHY Parameter 1 Register (offset 78h) are active for configuration of the amplitude and de-emphasis.

The final drive amplitude and drive de-emphasis are the summation of the base level value and the offset value. The offset value for drive amplitude is 25 mV pd, and 6.25 mV pd for drive de-emphasis.

The driver output waveform is the synthesis of amplitude and de-emphasis as shown in Figure 5-1. The driver amplitude without de-emphasis is specified as a peak differential voltage level (mVpd), and the driver de-emphasis modifies the driver amplitude.

Figure 5-1 Driver Output Waveform

## 5.1.6 DRIVE AMPLITUDE

Only one of the Drive Amplitude Level field in the Switch Operation Mode Register (offset 74h, bit[20:16], bit[25:21] and bit[30:26]) listed in Table 5-5 is active depending on the de-emphasis and swing condition. The settings and the corresponding values of the amplitude level are listed in Table 5-6, which can be configured by EEPROM or SMBUS settings.

Table 5-5 Drive Amplitude Base Level Registers

| Active Register    | De-Emphasis Condition | Swing Condition |
|--------------------|-----------------------|-----------------|
| C_DRV_LVL_3P5_NOM  | -3.5 db               | Full            |
| C_DRV_LVL_6P0_NOM  | -6.0 db               | Full            |
| C DRV LVL HALF NOM | N/A                   | Half            |

| Setting | Amplitude<br>(mV pd) | Setting | Amplitude<br>(mV pd) | Setting | Amplitude<br>(mV pd) |
|---------|----------------------|---------|----------------------|---------|----------------------|
| 00000   | 0                    | 00111   | 175                  | 01110   | 350                  |
| 00001   | 25                   | 01000   | 200                  | 01111   | 375                  |
| 00010   | 50                   | 01001   | 225                  | 10000   | 400                  |
| 00011   | 75                   | 01010   | 250                  | 10001   | 425                  |
| 00100   | 100                  | 01011   | 275                  | 10010   | 450                  |
| 00101   | 125                  | 01100   | 300                  | 10011   | 475                  |
| 00110   | 150                  | 01101   | 325                  | Others  | Reserved             |

Note:

1. Nominal levels. Actual levels will vary with temperature, voltage and board effects.

- 2. The maximum nominal amplitude of the output driver is 475 mV pd. Combined values of driver amplitude and de-emphasis greater than 475 mV pd should be avoided.
- 3. At higher amplitudes, actual swings will be less than the theoretical value due to process variations and environment factors, such as voltage overhead compression, package losses, board losses, and other effects.

### 5.1.7 DRIVE DE-EMPHASIS

The Drive De-Emphasis Level field in the PHY Parameter 1 Register (Offset 78h, bit[20:16], bit[25:21] and bit[30:26]) listed in Table 5-7 controls the de-emphasis base level. The settings and the corresponding values of the de-emphasis level are listed in Table 5-8, which can be globally via EEPROM or SMBUS settings.

| Table | 5-7 Driv | e De-Emphasis | <b>Base Level</b> | Register |
|-------|----------|---------------|-------------------|----------|
|       |          |               |                   |          |

| Register                | <b>De-Emphasis Condition</b> |
|-------------------------|------------------------------|
| C_EMP_POST_GEN1_3P5_NOM | -3.5 db                      |
| C_EMP_POST_GEN2_3P5_NOM | -3.5 db                      |
| C_EMP_POST_GEN2_6P0_NOM | -6.0 db                      |

| Table | 5-8 Drive | <b>De-Emphasis</b> | <b>Base Level</b> | Settings |
|-------|-----------|--------------------|-------------------|----------|
|-------|-----------|--------------------|-------------------|----------|

| Setting | De-Emphasis<br>(mV pd) | Setting | De-Emphasis<br>(mV pd) | Setting | De-Emphasis<br>(mV pd) |
|---------|------------------------|---------|------------------------|---------|------------------------|
| 00000   | 0.0                    | 01011   | 69.0                   | 10110   | 137.5                  |
| 00001   | 6.0                    | 01100   | 75.0                   | 10111   | 144.0                  |
| 00010   | 12.5                   | 01101   | 81.0                   | 11000   | 150.0                  |
| 00011   | 19.0                   | 01110   | 87.0                   | 11001   | 156.0                  |
| 00100   | 25.0                   | 01111   | 94.0                   | 11010   | 162.5                  |
| 00101   | 31.0                   | 10000   | 100.0                  | 11011   | 169.0                  |
| 00110   | 37.5                   | 10001   | 106.0                  | 11100   | 175.0                  |
| 00111   | 44.0                   | 10010   | 112.5                  | 11101   | 181.0                  |
| 01000   | 50.0                   | 10011   | 119.0                  | 11110   | 187.5                  |
| 01001   | 56.0                   | 10100   | 125.0                  | 11111   | 194.0                  |
| 01010   | 62.5                   | 10101   | 131.0                  | -       | -                      |

Note:

1. Nominal levels. Actual levels will vary with temperature, voltage and board effects.

2. The maximum nominal amplitude of the output driver is 475 mV pd. Combined values of driver amplitude and de-emphasis greater than 475 mV pd should be avoided.

3. At higher amplitudes, actual swings will be less than the theoretical value due to process variations and environment factors, such as voltage overhead compression, package losses, board losses, and other effects.

### 5.1.8 TRANSMITTER ELECTRICAL IDLE LATENCY

After the last character of the PCI Express transmission, the output current is reduced, and a differential voltage of less than 20 mV with common mode of VTX-CM-DC is established within 20 UI. This delay time is programmable via Transmitter PHY Latency field in the PHY Parameter 2 Register (Offset 7Ch, bit[3:0]), which can be configured by EEPROM or SMBUS settings.

## 5.2 DATA LINK LAYER (DLL)

The Data Link Layer (DLL) provides a reliable data transmission between two PCI Express points. An ACK/NACK protocol is employed to guarantee the integrity of the packets delivered. Each Transaction Layer Packet (TLP) is protected by a 32-bit LCRC for error detection. The DLL receiver performs LCRC calculation to determine if the incoming packet is corrupted in the serial link. If an LCRC error is found, the DLL transmitter would issue a NACK data link layer packet (DLLP) to the opposite end to request a re-transmission, otherwise an ACK DLLP would be sent out to acknowledge on reception of a good TLP.

In the transmitter, a retry buffer is implemented to store the transmitted TLPs whose corresponding ACK/NACK DLLP have not been received yet. When an ACK is received, the TLPs with sequence number equals to and smaller than that carried in the ACK would be flushed out from the buffer. If a NACK is received or no ACK/NACK is returned from the link partner after the replay timer expires, then a replay mechanism built in DLL transmitter is triggered to re-transmit the corresponding packet that receives NACK or time-out and any other TLP transmitted after that packet.

Meanwhile, the DLL is also responsible for the initialization, updating, and monitoring of the flow-control credit. All of the flow control information is carried by DLLP to the other end of the link. Unlike TLP, DLLP is guarded by 16-bit CRC to detect if data corruption occurs.

In addition, the Media Access Control (MAC) block, which is consisted of LTSSM, multiple lanes de-skew, scrambler/de-scrambler, clock correction from inserting skip order-set, and PIPE-related control/status circuits, is implemented to interface physical layer with data link layer.

# 5.3 TRANSACTION LAYER RECEIVE BLOCK (TLP DECAPSULATION)

The receiving end of the transaction layer performs header information retrieval and TC/VC mapping (see section 5.5), and it validates the correctness of the transaction type and format. If the TLP is found to contain an illegal header or the indicated packet length mismatches with the actual packet length, then a Malformed TLP is reported as an error associated with the receiving port. To ensure end-to-end data integrity, a 32-bit ECRC is checked against the TLP at the receiver if the digest bit is set in header.

# 5.4 ROUTING

The transaction layer implements three types of routing protocols: ID-based, address-based, and implicit routing. For configuration reads, configuration writes, transaction completion, and user-defined messages, the packets are routed by their destination ID constituted of bus number, device number, and function number. Address routing is employed to forward I/O or memory transactions to the destination port, which is located within the address range indicated by the address field carried in the packet header. The packet header indicates the packet types including memory read, memory write, IO read, IO write, Message Signaling Interrupt (MSI) and user-defined message. Implicit routing is mainly used to forward system message transactions such as virtual interrupt line, power management, and so on. The message type embedded in the packet header determines the routing mechanism.

If the incoming packet can not be forwarded to any other port due to a miss to hit the defined address range or targeted ID, this is considered as Unsupported Request (UR) packet, which is similar to a master abort event in PCI protocol.

## 5.5 TC/VC MAPPING

The 3-bit TC field defined in the header identifies the traffic class of the incoming packets. To enable the differential service, a TC/VC mapping table at destination port that is pre-programmed by system software or EEPROM pre-load is utilized to cast the TC labeled packets into the desired virtual channel. Note that TC0 traffic is mapped into VC0 channel by default. After the TC/VC mapping, the receive block dispatches the incoming request, completion, or data into the appropriate VC0 and VC1 queues.

### 5.6 QUEUE

In PCI Express, it defines six different packet types to represent request, completion, and data. They are respectively Posted Request Header (PH), Posted Request Data payload (PD), Non-Posted Request Header (NPH), Non-Posted Data Payload (NPD), Completion Header (CPLH) and Completion Data payload (CPLD). Each packet with different type would be put into a separate queue in order to facilitate the following ordering processor. Since NPD usually contains one DW, it can be merged with the corresponding NPH into a common queue named NPHD. Except NPHD, each virtual channel (VC0 or VC1) has its own corresponding packet header and data queue. When only VC0 is needed in some applications, VC1 can be disabled and its resources assigned to VC0 by asserting VC1\_EN (Virtual Channel 1 Enable) to low.

#### 5.6.1 PH

PH queue provides TLP header spaces for posted memory writes and various message request headers. Each header space occupies sixteen bytes to accommodate 3 DW or 4 DW headers. There are two PH queues for VC0 and VC1 respectively.

#### 5.6.2 PD

PD queue is used for storing posted request data. If the received TLP is of the posted request type and is determined to have payload coming with the header, the payload data would be put into PD queue. There are two PD queues for VC0 and VC1 respectively.

#### 5.6.3 NPHD

NPHD queue provides TLP header spaces for non-posted request packets, which include memory read, IO read, IO write, configuration read, and configuration write. Each header space takes twenty bytes to accommodate a 3-DW header, s 4-DW header, s 3-WD header with 1-DW data, and a 4-DW header with 1-DW data. There is only one NPHD queue for VC0, since non-posted request cannot be mapped into VC1.

#### 5.6.4 CPLH

CPLH queue provides TLP header space for completion packets. Each header space takes twelve bytes to accommodate a 3-DW header. Please note that there are no 4-DW completion headers. There are two CPLH queues for VC0 and VC1 respectively.

#### 5.6.5 CPLD

CPLD queue is used for storing completion data. If the received TLP is of the completion type and is determined to have payload coming with the header, the payload data would be put into CPLD queue. There are two CPLD queues for VC0 and VC1 respectively.

# 5.7 TRANSACTION ORDERING

Within a VPPB, a set of ordering rules is defined to regulate the transactions on the PCI Express Switch including Memory, IO, Configuration and Messages, in order to avoid deadlocks and to support the Producer-Consumer model. The ordering rules defined in table 5-4 apply within a single Traffic Class (TC). There is no ordering requirement among transactions within different TC labels. Since the transactions with the same TC label are not allowed to map into different virtual channels, it implies no ordering relationship between the traffic in VC0 and VC1.

| Row Pass Column          | Posted              | Read             | Non-posted Write | Read             | Non-posted Write |
|--------------------------|---------------------|------------------|------------------|------------------|------------------|
|                          | Request             | Request          | Request          | Completion       | Completion       |
| Posted Request           | Yes/No <sup>1</sup> | Yes <sup>5</sup> | Yes <sup>5</sup> | Yes <sup>5</sup> | Yes <sup>5</sup> |
| Read Request             | No <sup>2</sup>     | Yes              | Yes              | Yes              | Yes              |
| Non-posted Write Request | No <sup>2</sup>     | Yes              | Yes              | Yes              | Yes              |
| Read Completion          | Yes/No <sup>3</sup> | Yes              | Yes              | Yes              | Yes              |
| Non-Posted Write         | Yes <sup>4</sup>    | Yes              | Yes              | Yes              | Yes              |
| Completion               |                     |                  |                  |                  |                  |

#### Table 5-9 Summary of PCI Express Ordering Rules

1. When the Relaxed Ordering Attribute bit is cleared, the Posted Request transactions including memory write and message request must complete on the egress bus of VPPB in the order in which they are received on the ingress bus of VPPB. If the Relaxed Ordering Attribute bit is set, the Posted Request is permitted to pass over other Posted Requests occurring before it.

2. A Read Request transmitting in the same direction as a previously queued Posted Request transaction must push the posted write data ahead of it. The Posted Request transaction must complete on the egress bus before the Read Request can be attempted on the egress bus. The Read transaction can go to the same location as the Posted data. Therefore, if the Read transaction were to pass the Posted transaction, it would return stale data.

3. When the Relaxed Ordering Attribute bit is cleared, a Read completion must "pull" ahead of previously queued posted data transmitting in the same direction. In this case, the read data transmits in the same direction as the posted data, and the requestor of the read transaction is on the same side of the VPPB as the completer of the posted transaction. The posted transaction must deliver to the completer before the read data is returned to the requestor. If the Relaxed Ordering Attribute bit is set, then a read completion is permitted to pass a previously queued Memory Write or Message Request.

4. Non-Posted Write Completions are permitted to pass a previous Memory Write or Message Request transaction. Such transactions are actually transmitting in the opposite directions and hence have no ordering relationship.

5. Posted Request transactions must be given opportunities to pass Non-posted Read and Write Requests as well as Completions. Otherwise, deadlocks may occur when some older bridges, which do not support delayed transactions are mixed with PCIe Switch in the same system. A fairness algorithm is used to arbitrate between the Posted Write queue and the Non-posted transaction queue

## 5.8 PORT ARBITRATION

Among multiple ingress ports, the port arbitration built in the egress port determines which incoming packets to be forwarded to the output port. The arbitration algorithm contains hardware fixed Round Robin, 128-phase Weighted Round-Robin and programmable 128-phase time-based WRR. The port arbitration is held within the same VC channel. It means that each port has two port arbitration circuitries for VC0 and VC1 respectively. At the upstream ports, in addition to the inter-port packets, the intra-port packet such as configurations completion would also join the arbitration loop to get the service from Virtual Channel 0.

## 5.9 VC ARBITRATION

After port arbitration, VC arbitration is executed among different VC channels within the same source. Three arbitration algorithms are provided to choose the appropriate VC: Strict Priority, Round Robin or Weighted Round Robin.

# 5.10 FLOW CONTROL

PCI Express employs Credit-Based Flow Control mechanism to make buffer utilization more efficient. The transaction layer transmitter ensures that it does not transmit a TLP to an opposite receiver unless the receiver has enough buffer space to accept the TLP. The transaction layer receiver has the responsibility to advertise the free buffer space to an opposite transmitter to avoid packet stale. In this Switch, each port has its own separate queues for different traffic types and the credits are sent to data link layer on the fly. The data link layer compares the current available credits with the monitored ones and reports the updated credit to the counterpart. If no new credit is acquired, the credit reported is scheduled for every 30 us to prevent the link from entering retrain. On the other hand, the receiver at each egress port gets the usable credits from the opposite end in a link. The output port broadcasts them to all the other ingress ports to get packet transmission.

# 5.11 TRANSATION LAYER TRANSMIT BLOCK (TLP ENCAPSULATION)

The transmit portion of transaction layer performs the following functions. They construct the all types of forwarded TLP generated from VC arbiter, respond with the completion packets when the local resource (i.e. configuration register) is accessed, and regenerate the message that terminates at receiver to RC if acting as an upstream port.

# 6 EEPROM INTERFACE AND SYSTEM MANAGEMENT BUS

The EEPROM interface consists of two pins: EECLK (EEPROM clock output) and EEPD (EEPROM bi-directional serial data). The Switch may control an ISSI IS24C04 or compatible parts using into 512x8 bits. The EEPROM is used to initialize a number of registers before enumeration. This is accomplished after PRST# is de-asserted, at which time the data from the EEPROM is loaded. The EEPROM interface is organized into a 16-bit base, and the Switch supplies a 7-bit EEPROM word address. The Switch does not control the EEPROM address input. It can only access the EEPROM with address input set to 0.

The System Management Bus interface consists of two pins: SMBCLK (System Management Bus Clock input) and SMBDATA (System Management Bus Data input/ output).

### 6.1 EEPROM INTERFACE

### 6.1.1 AUTO MODE EERPOM ACCESS

The Switch may access the EEPROM in a WORD format by utilizing the auto mode through a hardware sequencer. The EEPROM start-control, address, and read/write commands can be accessed through the configuration register. Before each access, the software should check the Autoload Status bit before issuing the next start.

### 6.1.2 EEPROM MODE AT RESET

During a reset, the Switch will automatically load the information/data from the EEPROM if the automatic load condition is met. The first offset in the EEPROM contains a signature. If the signature is recognized, the autoload initiates right after the reset.

During the autoload, the Bridge will read sequential words from the EEPROM and write to the appropriate registers. Before the Bridge registers can be accessed through the host, the autoload condition should be verified by reading bit [3] offset DCh (EEPROM Autoload Status). The host access is allowed only after the status of this bit is set to '0' which indicates that the autoload initialization sequence is complete.

### 6.1.3 EEPROM SPACE ADDRESS MAP

| 15 - 8  | 7 - 0  | BYTE OFFSET |
|---|--|-------------|
| EEPROM Sign   | 00h  |             |
| Vend  | or ID  | 02h         |
| Devi  | ce ID  | 04h         |
| Extended VC Count / Link Capability / Switch                  | Mode Operation / Interrupt pin for Port $1 \sim 2$ | 06h         |
| Subsystem   | Vender ID  | 08h         |
| Subsys  | tem ID   | 0Ah         |
| Max_Payload_Size Support / ASPM                               | Support / Role_Base Error Reporting                | 0Ch         |
| Global PHY TX Margin  | Parameter for Port 0~2                             | 0Eh         |
| Global PHY Parameter 0 for Port 0~2                           |  | 10h         |
| Global XPIP_CSR6[0] / Global PHY Parameter 1 for Port 0~2     |  | 12h         |

# 6.2 SMBus INTERFACE

The PI7C9X2G303EL provides the System Management Bus (SMBus), a two-wire interface through which a simple device can communicate with the rest of the system. The SMBus interface on the PI7C9X2G303EL is a bidirectional slave interface. It can receive data from the SMBus master or send data to the master. The interface allows full access to the configuration registers. A SMBus master, such as the processor or other SMBus devices, can read or write to every RW configuration register (read/write register). In addition, the RO and HwInt registers (read-only and hard ware initialized registers) that can be auto-loaded by the EEPROM interface can also be read and written by the SMBus interface. This feature allows increases in the system expandability and flexibility in systemimplementation.

Figure 6-1 SMBus Architecture Implementation on PI7C9X2G303EL

The SMBus interface on the PI7C9X2G303EL consists of one SMBus clock pin (SMBCLK), a SMBus data pin (SMBDATA), and 3 SMBus address pins (GPIO[5:7]). The SMBus clock pin provides or receives the clock signal. The SMBus data pin facilitates the data transmission and reception. Both of the clock and data pins are bidirectional. The SMBus address pins determine the address to which the PI7C9X2G303EL responds to. The SMBus address pins generate addresses according to the following table:

#### Table 6-1 SMBus Address Pin Configuration

| BIT | SMBus Address |
|-----|---------------|
| 0   | GPIO[5]       |
| 1   | GPIO[6]       |
| 2   | GPIO[7]       |
| 3   | 1             |
| 4   | 0             |
| 5   | 1             |
| 6   | 1             |

# 7 **REGISTER DESCRIPTION**

# 7.1 REGISTER TYPES

| REGISTER TYPE | DEFINITIO N                           |
|---------------|---------------------------------------|
| HwInt         | Hardware Initialization               |
| RO            | Read Only                             |
| RW            | Read / Write                          |
| RWC           | Read / Write 1 to Clear               |
| RWCS          | Sticky – Read Only / Write 1 to Clear |
| RWS           | Sticky – Read / Write                 |
| ROS           | Sticky – Read Only                    |

### 7.2 TRANSPARENT MODE CONFIGURATION REGISTERS

When the port of the Switch is set to operate at the transparent mode, it is represented by a logical PCI-to-PCI Bridge that implements type 1 configuration space header. The following table details the allocation of the register fields of the PCI 2.3 compatible type 1 configuration space header.

| 31 - 24                    | 23 - 16                       | 15 - 8                    | 7 –0                              | BYTE OFFSET |  |  |  |

Other than the PCI 2.3 compatible configuration space header, the Switch also implements PCI express extended configuration space header, which includes advanced error reporting, virtual channel, and power budgeting capability registers. The following table details the allocation of the register fields of PCI express extended capability space header. The first extended capability always begins at offset 100h with a PCI Express Enhanced Capability header and the rest of capabilities are located at an offset greater than 0FFh relative to the beginning of PCI compatible configuration space.

# 7.2.1 VENDOR ID REGISTER – OFFSET 00h

| BIT  | FUNCTIO N | TYPE | DESCRIPTION   |
|------|-----------|------|---|
| 15:0 | Vendor ID | RO   | Identifies Pericom as the vendor of this device. The default value may be<br>changed by SMBus or auto-loading from EEPROM.<br>Reset to 12D8h. |

## 7.2.2 DEVICE ID REGISTER – OFFSET 00h

| BIT   | FUNCTIO N    | TYPE  | DESCRIPTION      |
|-------|--------------|---|------------------|
| 31:16 | Device ID RO | Identifies this device as the PI7C9X2G303EL. The default value may be changed by SMBus or auto-loading from EEPROM. |                  |
|       |              |   | Resets to 2303h. |

## 7.2.3 COMMAND REGISTER – OFFSET 04h

| BIT | <b>FUNCTION</b>                       | TYPE | DESC RIPTIO N   |
|-----|---------------------------------------|------|---|
| 0   | I/O Space Enable                      | RW   | 0b: Ignores I/O transactions on the primary interface<br>1b: Enables responses to I/O transactions on the primary interface<br>Resets to 0b.  |
| 1   | Memory Space<br>Enable                | RW   | 0b: Ignores memory transactions on the primary interface<br>1b: Enables responses to memory transactions on the primary interface<br>Reset to 0b.   |
| 2   | Bus Master Enable                     | RW   | <ul> <li>Ob: Does not initiate memory or I/O transactions on the upstream port and handles as an Unsupported Request (UR) to memory and I/O transactions on the downstream port. For Non-Posted Requests, a completion with UR completion status must be returned</li> <li>1b: Enables the Switch Port to forward memory and I/O Read/Write transactions in the upstream direction</li> <li>Reset to 0b.</li> </ul> |
| 3   | Special Cycle Enable                  | RO   | Does not apply to PCI Express. Must be hardwired to 0b.   |
| 4   | Memory Write And<br>Invalidate Enable | RO   | Does not apply to PCI Express. Must be hardwired to 0b.   |
| 5   | VGA Palette Snoop                     | RO   | Does not apply to PCI Express. Must be hardwired to 0b.   |

| BIT   | FUNCTIO N                       | TYPE  | DESCRIPTION  |
|-------|---------------------------------|-------|--|
|       | Enable                          |       |  |
| 6     | Parity Error<br>Response Enable | RW    | <ul> <li>0b: Switch may ignore any parity errors that it detects and continue normal operation</li> <li>1b: Switch must take its normal action when a parity error is detected</li> <li>Reset to 0b.</li> </ul>                |
| 7     | Wait Cycle Control              | RO    | Does not apply to PCI Express. Must be hardwired to 0.   |
| 8     | SERR# enable                    | RW    | <ul> <li>0b: Disables the reporting of Non-fatal and Fatal errors detected by the<br/>Switch to the Root Complex</li> <li>b1: Enables the Non-fatal and Fatal error reporting to Root Complex</li> <li>Reset to 0b.</li> </ul> |
| 9     | Fast Back-to-Back<br>Enable     | RO    | Does not apply to PCI Express. Must be hardwired to 0b.  |
| 10    | Interrupt Disable               | RW    | Controls the ability of a PCI Express device to generate INTx Interrupt<br>Messages. In the Switch, this bit does not affect the forwarding of INTx<br>messages from the downstream ports.<br>Reset to 0b.                     |
| 15:11 | Reserved                        | RsvdP | Not Support.   |

# 7.2.4 PRIMARY STATUS REGISTER – OFFSET 04h

| BIT   | <b>FUNCTION</b>             | TYPE  | DESCRIPTION   |
|-------|-----------------------------|-------|---|
| 18:16 | Reserved                    | RsvdP | Not Support.  |
| 19    | Interrupt Status            | RO    | Indicates that an INTx Interrupt Message is pending internally to the device.<br>In the Switch, the forwarding of INTx messages from the downstream device<br>of the Switch port is not reflected in this bit. Must be hardwired to 0b. |
| 20    | Capabilities List           | RO    | Set to 1 to enable support for the capability list (offset 34h is the pointer to the data structure).<br>Reset to 1b.   |
| 21    | 66MHz Capable               | RO    | Does not apply to PCI Express. Must be hardwired to 0b.   |
| 21    | Reserved                    | RsvdP | Not Support.  |
| 22    | Fast Back-to-Back           |       | Does not apply to PCI Express. Must be hardwired to 0b.   |
| 23    | Capable                     | RO    |   |
| 24    | Master Data Parity<br>Error | RWC   | Set to 1 (by a requester) whenever a Parity error is detected or forwarded on<br>the primary side of the port in a Switch.<br>If the Parity Error Response Enable bit is cleared, this bit is never set.<br>Reset to 0b.                |
| 26:25 | DEVSEL# timing              | RO    | Does not apply to PCI Express. Must be hardwired to 0b.   |
| 27    | Signaled Target<br>Abort    | RO    | Set to 1 (by a completer) whenever completing a request on the primary side<br>using the Completer Abort Completion Status.<br>Reset to 0b.   |
| 28    | Received Target<br>Abort    | RO    | Set to 1 (by a requestor) whenever receiving a Completion with Completer<br>Abort Completion Status on the primary side.<br>Reset to 0b.  |
| 29    | Received Master<br>Abort    | RO    | Set to 1 (by a requestor) whenever receiving a Completion with Unsupported<br>Request Completion Status on primary side.<br>Reset to 0b.  |
| 30    | Signaled System<br>Error    | RWC   | Set to 1 when the Switch sends an ERR_FATAL or ERR_NONFATAL<br>Message, and the SERR Enable bit in the Command register is 1.<br>Reset to 0b.   |
| 31    | Detected Parity Error       | RWC   | Set to 1 whenever the primary side of the port in a Switch receives a Poisoned TLP.<br>Reset to 0b.   |

#### 7.2.5 REVISION ID REGISTER - OFFSET 08h

| BIT | <b>FUNCTION</b> | TYPE | DESCRIPTION  |
|-----|-----------------|------|--|
| 7:0 | Revision        | RO   | Indicates revision number of device. Hardwired to 05h. |

#### 7.2.6 CLASS CODE REGISTER – OFFSET 08h

| BIT   | FUNCTIO N       | TYPE | DESCRIPTION   |
|-------|-----------------|------|---|
| 15:8  | Programming     | RO   | Read as 00h to indicate no programming interfaces have been defined for |
|       | Interface       |      | PCI-to-PCI Bridges.   |
| 23:16 | Sub-Class Code  | RO   | Read as 04h to indicate device is a PCI-to-PCI Bridge.                  |
| 31:24 | Base Class Code | RO   | Read as 06h to indicate device is a Bridge device.                      |

#### 7.2.7 CACHE LINE REGISTER – OFFSET 0Ch

| BIT | FUNC TIO N      | TYPE | DESCRIPTION   |
|-----|-----------------|------|---|
| 7:0 | Cache Line Size | RW   | The cache line size register is set by the system firmware and the operating<br>system cache line size. This field is implemented by PCI Express devices as a<br>RW field for legacy compatibility, but it has no impact on any PCI Express<br>device functionality.<br>Reset to 00h. |

#### 7.2.8 PRIMARY LATENCY TIMER REGISTER – OFFSET 0Ch

| BIT  | FUNC TIO N            | TYPE | DESCRIPTION  |
|------|-----------------------|------|--|
| 15:8 | Primary Latency timer | RO   | Does not apply to PCI Express. Must be hardwired to 00h. |

#### 7.2.9 HEADER TYPE REGISTER – OFFSET 0Ch

| BIT   | FUNC TIO N  | TYPE | DESCRIPTION   |
|-------|-------------|------|---|
| 23:16 | Header Type | RO   | Read as 01h to indicate that the register layout conforms to the standard PCI-<br>to-PCI Bridge layout. |

#### 7.2.10 PRIMARY BUS NUMBER REGISTER - OFFSET 18h

| BIT | FUNCTIO N          | TYPE | DESCRIPTION   |
|-----|--------------------|------|---|
| 7:0 | Primary Bus Number | RW   | Indicates the number of the PCI bus to which the primary interface is connected. The value is set in software during configuration. |
|     |                    |      | Reset to 00h.   |

#### 7.2.11 SECONDARY BUS NUMBER REGISTER – OFFSET 18h

| BIT  | FUNC TIO N              | TYPE | DESCRIPTION  |
|------|-------------------------|------|--|
| 15:8 | Secondary Bus<br>Number | RW   | Indicates the number of the PCI bus to which the secondary interface is connected. The value is set in software during configuration.<br>Reset to 00h. |

#### 7.2.12 SUBORDINATE BUS NUMBER REGISTER – OFFSET 18h

| BIT   | FUNCTIO N                 | TYPE | DESC RIPTIO N   |
|-------|---------------------------|------|---|
| 23:16 | Subordinate Bus<br>Number | RW   | Indicates the number of the PCI bus with the highest number that is subordinate to the Bridge. The value is set in software during configuration. |
|       |                           |      | Reset to 00h.   |

#### 7.2.13 SECONDARY LATENCY TIMER REGISTER – OFFSET 18h

| BIT   | <b>FUNCTION</b>            | TYPE | DESCRIPTION  |
|-------|----------------------------|------|--|
| 31:24 | Secondary Latency<br>Timer | RO   | Does not apply to PCI Express. Must be hardwired to 00h. |

### 7.2.14 VO BASE ADDRESS REGISTER – OFFSET 1Ch

| BIT | FUNCTION                    | TYPE | DESCRIPTION  |
|-----|-----------------------------|------|--|
| 3:0 | 32-bit Indicator            | RO   | Read as 01h to indicate 32-bit I/O addressing.   |
| 7:4 | I/O Base Address<br>[15:12] | RW   | Defines the bottom address of the I/O address range for the Bridge to<br>determine when to forward I/O transactions from one interface to the other.<br>The upper 4 bits correspond to address bits [15:12] and are writable. The<br>lower 12 bits corresponding to address bits [11:0] are assumed to be 0. The<br>upper 16 bits corresponding to address bits [31:16] are defined in the I/O base<br>address upper 16 bits address register.<br>Reset to 0h. |

#### 7.2.15 VO LIMIT ADDRESS REGISTER - OFFSET 1Ch

| BIT   | FUNC TIO N                   | TYPE | DESCRIPTION   |
|-------|------------------------------|------|---|
| 11:8  | 32-bit Indicator             | RO   | Read as 01h to indicate 32-bit I/O addressing.  |
| 15:12 | I/O Limit Address<br>[15:12] | RW   | Defines the top address of the I/O address range for the Bridge to determine<br>when to forward I/O transactions from one interface to the other. The upper 4<br>bits correspond to address bits [15:12] and are writable. The lower 12 bits<br>corresponding to address bits [11:0] are assumed to be FFFh. The upper 16<br>bits corresponding to address bits [31:16] are defined in the I/O limit address<br>upper 16 bits address register.<br>Reset to 0h. |

### 7.2.16 SECONDARY STATUS REGISTER - OFFSET 1Ch

| BIT   | FUNCTIO N                    | TYPE  | DESCRIPTION   |
|-------|------------------------------|-------|---|
| 20:16 | Reserved                     | RsvdP | Not Support.  |
| 21    | 66MHz Capable                | RO    | Does not apply to PCI Express. Must be hardwired to 0b.   |
| 22    | Reserved                     | RsvdP | Not Support.  |
| 23    | Fast Back-to-Back<br>Capable | RO    | Does not apply to PCI Express. Must be hardwired to 0b.   |
|       |                              |       | Set to 1 (by a requester) whenever a Parity error is detected or forwarded on the secondary side of the port in a Switch. |
| 24    | Master Data Parity<br>Error  | RWC   | If the Parity Error Response Enable bit is cleared, this bit is never set.  |
|       |                              |       | Reset to 0b.  |

| BIT   | FUNCTION                 | TYPE | DESCRIPTION  |
|-------|--------------------------|------|--|
| 26:25 | DEVSEL_L timing          | RO   | Does not apply to PCI Express. Must be hardwired to 0b.  |
| 27    | Signaled Target<br>Abort | RO   | Set to 1 (by a completer) whenever completing a request in the secondary side using Completer Abort Completion Status.<br>Reset to 0b.               |
| 28    | Received Target<br>Abort | RO   | Set to 1 (by a requestor) whenever receiving a Completion with Completer<br>Abort Completion Status in the secondary side.<br>Reset to 0b.           |
| 29    | Received Master<br>Abort | RO   | Set to 1 (by a requestor) whenever receiving a Completion with Unsupported<br>Request Completion Status in secondary side.<br>Reset to 0b.           |
| 30    | Received System<br>Error | RWC  | Set to 1 when the Switch sends an ERR_FATAL or ERR_NONFATAL<br>Message, and the SERR Enable bit in the Bridge Control register is 1.<br>Reset to 0b. |
| 31    | Detected Parity Error    | RWC  | Set to 1 whenever the secondary side of the port in a Switch receives a Poisoned TLP.<br>Reset to 0b.  |

## 7.2.17 MEMORY BASE ADDRESS REGISTER – OFFSET 20h

| BIT  | <b>FUNCTION</b>               | TYPE  | DESCRIPTION  |
|------|-------------------------------|-------|--|
| 3:0  | Reserved                      | RsvdP | Not Support.   |
| 15:4 | Memory Base<br>Address [15:4] | RW    | Defines the bottom address of an address range for the Bridge to determine<br>when to forward memory transactions from one interface to the other. The<br>upper 12 bits correspond to address bits [31:20] and are able to be written to.<br>The lower 20 bits corresponding to address bits [19:0] are assumed to be 0.<br>Reset to 000h. |

## 7.2.18 MEMORY LIMIT ADDRESS REGISTER - OFFSET 20h

| BIT   | FUNCTIO N                       | TYPE  | DESCRIPTION   |
|-------|---------------------------------|-------|---|
| 19:16 | Reserved                        | RsvdP | Not Support.  |
| 31:20 | Memory Limit<br>Address [31:20] | RW    | Defines the top address of an address range for the Bridge to determine when<br>to forward memory transactions from one interface to the other. The upper<br>12 bits correspond to address bits [31:20] and are writable. The lower 20 bits<br>corresponding to address bits [19:0] are assumed to be FFFFFh.<br>Reset to 000h. |

# 7.2.19 PREFETCHABLE MEMORY BASE ADDRESS REGISTER – OFFSET 24h

| BIT  | FUNCTIO N                                   | TYPE | DESC RIPTIO N   |
|------|---|------|---|
| 3:0  | 64-bit addressing                           | RO   | Read as 0001b to indicate 64-bit addressing.  |
| 15:4 | Prefetchable Memory<br>Base Address [31:20] | RW   | Defines the bottom address of an address range for the Bridge to determine<br>when to forward memory read and write transactions from one interface to the<br>other. The upper 12 bits correspond to address bits [31:20] and are writable.<br>The lower 20 bits are assumed to be 0. The memory base register upper 32<br>bits contain the upper half of the base address.<br>Reset to 000h. |

#### 7.2.20 PREFETCHABLE MEMORY LIMIT ADDRESS REGISTER – OFFSET 24h

| BIT   | <b>FUNCTION</b>                                 | TYPE | DESCRIPTION  |
|-------|---|------|--|
| 19:16 | 64-bit addressing                               | RO   | Read as 0001b to indicate 64-bit addressing.   |
| 31:20 | Prefetchable Memory<br>Limit Address<br>[31:20] | RW   | Defines the top address of an address range for the Bridge to determine when<br>to forward memory read and write transactions from one interface to the<br>other. The upper 12 bits correspond to address bits [31:20] and are writable.<br>The lower 20 bits are assumed to be FFFFFh. The memory limit upper 32 bits<br>register contains the upper half of the limit address.<br>Reset to 000h. |

#### 7.2.21 PREFETCHABLE MEMORY BASE ADDRESS UPPER 32-BITS REGISTER – OFFSET 28h

| BIT  | <b>FUNCTION</b>   | TYPE | DESCRIPTION  |
|------|---|------|--|
| 31:0 | Prefetchable Memory<br>Base Address, Upper<br>32-bits [63:32] | RW   | Defines the upper 32-bits of a 64-bit bottom address of an address range for<br>the Bridge to determine when to forward memory read and write transactions<br>from one interface to the other.<br>Reset to 0000_0000h. |

#### 7.2.22 PREFETCHABLE MEMORY LIMIT ADDRESS UPPER 32-BITS REGISTER – OFFSET 2Ch

| BIT  | <b>FUNCTION</b>   | TYPE | DESC RIPTIO N   |
|------|---|------|---|
| 31:0 | Prefetchable Memory<br>Limit Address,<br>Upper 32-bits<br>[63:32] | RW   | Defines the upper 32-bits of a 64-bit top address of an address range for the<br>Bridge to determine when to forward memory read and write transactions<br>from one interface to the other.<br>Reset to 0000_0000h. |

### 7.2.23 VO BASE ADDRESS UPPER 16-BITS REGISTER – OFFSET 30h

| BIT  | FUNCTION                                      | TYPE | DESCRIPTION   |
|------|---|------|---|
| 15:0 | I/O Base Address,<br>Upper 16-bits<br>[31:16] | RW   | Defines the upper 16-bits of a 32-bit bottom address of an address range for<br>the Bridge to determine when to forward I/O transactions from one interface<br>to the other.<br>Reset to 0000h. |

#### 7.2.24 VO LIMIT ADDRESS UPPER 16-BITS REGISTER – OFFSET 30h

| BIT   | FUNCTION                                       | TYPE | DESCRIPTION  |
|-------|--|------|--|
| 31:16 | I/O Limit Address,<br>Upper 16-bits<br>[31:16] | RW   | Defines the upper 16-bits of a 32-bit top address of an address range for the<br>Bridge to determine when to forward I/O transactions from one interface to<br>the other.<br>Reset to 0000h. |

#### 7.2.25 CAPABILITY POINTER REGISTER – OFFSET 34h

| BIT | <b>FUNCTION</b>    | TYPE | DESCRIPTION   |
|-----|--------------------|------|---|
| 7:0 | Capability Pointer | RO   | Pointer points to the PCI power management registers. |
| 7.0 | Capability Pointer | ĸo   | Reset to 40h.   |

## 7.2.26 INTERRUPT LINE REGISTER – OFFSET 3Ch

| BIT | <b>FUNCTION</b> | TYPE | DESCRIPTION   |
|-----|-----------------|------|---------------|
| 7:0 | Interrupt Line  | RW   | Reset to 00h. |

#### 7.2.27 INTERRUPT PIN REGISTER – OFFSET 3Ch

| BIT  | <b>FUNCTION</b> | TYPE | DESCRIPTION  |
|------|-----------------|------|--|
| 15:8 | Interrupt Pin   | RO   | The Switch implements INTA virtual wire interrupt signals to represent hot-<br>plug events at downstream ports. The default value on the downstream ports<br>may be changed by SMBus or auto-loading from EEPROM.<br>Reset to 00h. |

# 7.2.28 BRIDGE CONTROL REGISTER - OFFSET 3Ch

| BIT | <b>FUNCTION</b>          | TYPE | DESCRIPTION   |
|-----|--------------------------|------|---|
| 16  | Parity Error<br>Response | RW   | 0b: Ignore Poisoned TLPs on the secondary interface<br>1b: Enable the Poisoned TLPs reporting and detection on the secondary<br>interface<br>Reset to 0b.   |
| 17  | S_SERR# enable           | RW   | <ul> <li>0b: Disables the forwarding of EER_COR, ERR_NONFATAL and<br/>ERR_FAT AL from secondary to primary interface</li> <li>1b: Enables the forwarding of EER_COR, ERR_NONFATAL and<br/>ERR_FAT AL from secondary to primary interface</li> <li>Reset to 0b.</li> </ul>   |
| 18  | ISA Enable               | RW   | <ul> <li>Ob: Forwards downstream all I/O addresses in the address range defined by<br/>the I/O Base, I/O Base, and Limit registers</li> <li>1b: Forwards upstream all I/O addresses in the address range defined by the<br/>I/O Base and Limit registers that are in the first 64KB of PCI I/O address<br/>space (top 768 bytes of each 1KB block)</li> <li>Reset to 0b.</li> </ul> |
| 19  | VGA Enable               | RW   | 0b: Ignores access to the VGA memory or IO address range<br>1b: Forwards transactions targeted at the VGA memory or IO address range<br>VGA memory range starts from 000A 0000h to 000B FFFFh<br>VGA IO addresses are in the first 64KB of IO address space.<br>AD [9:0] is in the ranges 3B0 to 3BBh and 3C0h to 3DFh.<br>Reset to 0b.   |
| 20  | VGA 16-bit decode        | RW   | 0b: Executes 10-bit address decoding on VGA I/O accesses<br>1b: Executes 16-bit address decoding on VGA I/O accesses<br>Reset to 0b.  |
| 21  | Master Abort Mode        | RO   | Does not apply to PCI Express. Must be hardwired to 0b.   |

| BIT   | FUNCTION                      | TYPE  | DESCRIPTION  |
|-------|-------------------------------|-------|--|
| 22    | Secondary Bus Reset           | RW    | <ul> <li>0b: Does not trigger a hot reset on the corresponding PCI Express Port</li> <li>1b: Triggers a hot reset on the corresponding PCI Express Port</li> <li>At the downstream port, it asserts PORT_RST# to the attached downstream device.</li> <li>At the upstream port, it asserts the PORT_RST# at all the downstream ports.</li> </ul> |
| 23    | Fast Back-to-Back<br>Enable   | RO    | Does not apply to PCI Express. Must be hardwired to 0b.  |
| 24    | Primary Master<br>Timeout     | RO    | Does not apply to PCI Express. Must be hardwired to 0b.  |
| 25    | Secondary Master<br>Timeout   | RO    | Does not apply to PCI Express. Must be hardwired to 0b.  |
| 26    | Master Timeout<br>Status      | RO    | Does not apply to PCI Express. Must be hardwired to 0b.  |
| 27    | Discard Timer<br>SERR# enable | RO    | Does not apply to PCI Express. Must be hardwired to 0b.  |
| 31:28 | Reserved                      | RsvdP | Not Support.   |

# 7.2.29 POWER MANAGEMENT CAPABILITY REGISTER – OFFSET 40h

| BIT   | <b>FUNCTION</b>                   | TYPE  | DESCRIPTION  |
|-------|-----------------------------------|-------|--|
| 7:0   | Enhanced<br>Capabilities ID       | RO    | Read as 01h to indicate that these are power management enhanced capability registers.   |
| 15:8  | Next Item Pointer                 | RO    | The pointer points to the Vital Protocol Data (VPD) capability register/the<br>Message capability register.<br>Reset to 5Ch (Upstream port).<br>Reset to 4Ch (Downstream ports). |
| 18:16 | Power Management<br>Revision      | RO    | Read as 011b to indicate the device is compliant to Revision 1.2 of PCI<br>Power Management Interface Specifications.  |
| 19    | PME# Clock                        | RO    | Does not apply to PCI Express. Must be hardwired to 0b.  |
| 20    | Reserved                          | RsvdP | Not Support.   |
| 21    | Device Specific<br>Initialization | RO    | Read as 0b to indicate Switch does not have device specific initialization requirements. The default value may be changed by SMBus or auto-loading from EEPROM.                  |
| 24:22 | AUX Current                       | RO    | Reset as 111b to indicate the Switch needs 375 mA in D3 state. The default value may be changed by SMBus or auto-loading from EEPROM.  |
| 25    | D1 Power State<br>Support         | RO    | Read as 1b to indicate Switch supports the D1 power management state. The default value may be changed by SMBus or auto-loading from EEPROM.                                     |
| 26    | D2 Power State<br>Support         | RO    | Read as 1 b to indicate Switch supports the D2 power management state. The default value may be changed by SMBus or auto-loading from EEPROM.                                    |
| 31:27 | PME# Support                      | RO    | Read as 11111b to indicate Switch supports the forwarding of PME# message<br>in all power states. The default value may be changed by SMBus or auto-<br>loading from EEPROM.     |

# 7.2.30 POWER MANAGEMENT DATA REGISTER - OFFSET 44h

| BIT | FUNCTIO N     | TYPE  | DESCRIPTION   |
|-----|---------------|-------|---|
| 1:0 | Power State   | RW    | Indicates the current power state of the Switch. Writing a value of D0 when<br>the previous state was D3 cause a hot reset without asserting DWNRST_L.<br>00b: D0 state<br>01b: D1 state<br>10b: D2 state<br>11b: D3 hot state<br>Reset to 00b. |
| 2   | Reserved      | RsvdP | Not Support.  |
| 3   | No_Soft_Reset | RO    | When set, this bit indicates that device transitioning from D3hot to D0 does  |

| BIT   | FUNCTION    | TYPE  | DESCRIPTION  |
|-------|-------------|-------|--|
|       |             |       | not perform an internal reset. When clear, an internal reset is performed when<br>power state transits from D3hot to D0. This bit can be rewritten with<br>EEPROM programming. The default value may be changed by SMBus or<br>auto-loading from EEPROM. |
|       |             |       | Reset to 1b.   |
| 7:4   | Reserved    | RsvdP | Not Support.   |
| 8     | PME# Enable | RWS   | When asserted, the Switch will generate the PME# message.<br>Reset to 0b.  |
| 12:9  | Data Select | RW    | Select data registers.<br>Reset to 0h.   |
| 14:13 | Data Scale  | RO    | Reset to 00b.  |
| 15    | PME status  | ROS   | Read as 0b as the PME# message is not implemented.<br>Reset to 0b.   |

## 7.2.31 PPB SUPPORT EXTENSIONS – OFFSET 44h

| BIT   | FUNCTION                               | TYPE  | DESCRIPTION   |

| 5   | EEPROM Autoload<br>Disable | RW   | 0b: EEPROM autoload enabled<br>1b: EEPROM autoload disabled<br>Reset to 1b.   |
| 7:6 | EEPROM Clock<br>Rate       | RW   | Determines the frequency of the EEPROM clock, which is derived from the<br>primary clock.<br>00b: Reserved<br>01b: PEXCLK / 1024 (PEXCLK is 125MHz)<br>10b: Reserved<br>11b: T est Mode<br>Reset to 01b.  |

#### 7.2.63 EEPROM ADDRESS REGISTER – OFFSET BCh (Upstream Port Only)

| BIT  | FUNCTIO N      | TYPE  | DESCRIPTION                                     |
|------|----------------|-------|---|
| 8    | Reserved       | RsvdP | Not Support.                                    |
| 15:9 | EEPROM Address | RW    | Contains the EEPROM address.<br>Reset to 0000h. |

## 7.2.64 EEPROM DATA REGISTER – OFFSET BCh (Upstream Port Only)

| BIT       | FUNCTION    | TYPE | DESCRIPTION   |
|-----------|-------------|------|---|
| 31:16 EEP | EEPROM Data | RW   | Contains the data to be written to the EEPROM. After completion of a read cycle, this register will contain the data from the EEPROM. |
|           |             |      | Reset to 0000h.   |

## 7.2.65 PCI EXPRESS CAPABILITY REGISTER – OFFSET C0h

| BIT   | FUNCTION                    | TYPE        | DESCRIPTION  |
|-------|-----------------------------|-------------|--|
| 7:0   | Enhanced<br>Capabilities ID | RO          | Read as 10h to indicate that these are PCI express enhanced capability registers.  |
| 15:8  | Next Item Pointer           | RO          | Read as 00h. No other ECP registers.   |
| 19:16 | Capability Version          | RO          | Read as 0010b to indicate the device is compliant to Revision .2.0a of <i>PCI Express Base Specifications</i> .  |
| 23:20 | Device/Port Type            | RO          | Indicates the type of PCI Express logical device.<br>Reset to 0101b (Upstream port).<br>Reset to 0110b (Downstream ports).   |
| 24    | Slot Implemented            | HwInt<br>RO | When set, indicates that the PCIe Link associated with this Port is connected<br>to a slot. This field is valid for downstream port of the Switch. The default<br>value may be changed by the status of strapped pin, SMBus or auto-loading<br>from EEPROM.<br>Reset to the status of SLOT_IMP strapped pin. |

| BIT   | FUNC TIO N                  | TYPE  | DESC RIPTIO N  |
|-------|-----------------------------|-------|--|
| 29:25 | Interrupt Message<br>Number | RO    | Read as 0b. No MSI messages are generated in the transparent mode. |
| 31:30 | Reserved                    | RsvdP | Not Support.   |

# 7.2.66 DEVICE CAPABILITIES REGISTER – OFFSET C4h

| BIT   | FUNCTION                                       | TYPE        | DESCRIPTION   |
|-------|--|-------------|---|
| 2:0   | Max_Payload_Size<br>Supported                  | HwInt<br>RO | Indicates the maximum payload size that the device can support for TLPs.<br>The default value may be changed by the status of strapped pin, SMBus or<br>auto-loading from EEPROM.<br>Reset to 001b when PL_512B strapped pin is set to 0.<br>Reset to 010b when PL_512B strapped pin is set to 1. |
| 4:3   | Phantom Functions<br>Supported                 | RO          | Indicates the support for use of unclaimed function numbers as P hantom<br>functions. Read as 00b, since the Switch does not act as a requester.<br>Reset to 00b.   |
| 5     | Extended Tag Field<br>Supported                | RO          | Indicates the maximum supported size of Tag field as a Requester. Read as 0, since the Switch does not act as a requester.<br>Reset to 0b.  |
| 8:6   | Endpoint L0s<br>Acceptable Latency             | RO          | Acceptable total latency that an Endpoint can withstand due to the transition<br>from L0s state to the L0 state. For Switch, the ASPM software would not<br>check this value.<br>Reset to 000b.   |
| 11:9  | Endpoint L1<br>Acceptable Latency              | RO          | Acceptable total latency that an Endpoint can withstand due to the transition<br>from L1 state to the L0 state. For Switch, the ASPM software would not<br>check this value.<br>Reset to 000b.  |
| 14:12 | Reserved                                       | RsvdP       | Not Support.  |
| 15    | Role_Based Error<br>Reporting                  | RO          | When set, indicates that the device implements the functionality originally defined in the Error Reporting ECN. The default value may be changed by SMBus or auto-loading from EEPROM.<br>Reset to 1b.  |
| 17:16 | Reserved                                       | RsvdP       | Not Support.  |
| 25:18 | Captured Slot Power<br>Limit Value             | RO          | It applies to Upstream Port only. In combination with the Slot Power Limit<br>Scale value, specifies the upper limit on power supplied by slot.<br>This value is set by the Set_Slot_Power_Limit message or hardwired to 00h.<br>Reset to 00h.  |
| 27:26 | Captured Slot Power<br>Limit Scale<br>Reserved | RO<br>RsvdP | It applies to Upstream Port only. Specifies the scale used for the Slot Power<br>Limit Value.<br>This value is set by the Set_Slot_Power_Limit message or hardwired to 00b.<br>Reset to 00b.  |
| 31.20 | Reserveu                                       | Ksvur       | Not Support.  |

# 7.2.67 DEVICE CONTROL REGISTER - OFFSET C8h

| BIT | FUNCTIO N         | TYPE | DESCRIPTION   |
|-----|-------------------|------|---|
| 0   | Correctable Error | DW   | 0b: Disable Correctable Error Reporting<br>1b: Enable Correctable Error Reporting |
| 0   | Reporting Enable  | RW   | Reset to 0b.  |

| BIT   | <b>FUNCTION</b>                         | TYPE  | DESC RIPTIO N  |
|-------|---|-------|--|
| 1     | Non-Fatal Error<br>Reporting Enable     | RW    | 0b: Disable Non-Fatal Error Reporting<br>1b: Enable Non-Fatal Error Reporting  |
|       |   |       | Reset to 0b.   |
| 2     | Fatal Error Reporting<br>Enable         | RW    | 0b: Disable Fatal Error Reporting<br>1b: Enable Fatal Error Reporting  |
|       |   |       | Reset to 0b.<br>0b: Disable Unsupported Request Reporting  |
| 3     | Unsupported Request<br>Reporting Enable | RW    | 1b: Enable Unsupported Request Reporting   |
|       |   |       | Reset to 0b.   |
| 4     | Enable Relaxed<br>Ordering              | RO    | When set, it permits the device to set the Relaxed Ordering bit in the attribute field of transaction. Since the Switch can not either act as a requester or alter the content of packet it forwards, this bit always returns '0' when read.   |
| 7:5   | Max_Payload_Size                        | RW    | Reset to 0b.<br>This field sets maximum TLP payload size for the device. Permissible values<br>that can be programmed are indicated by the Max_Payload_Size Supported in<br>the Device Capabilities register. Any value exceeding the Max_Payload_Size<br>Supported written to this register results into clamping to the<br>Max_Payload_Size Supported value.<br>Reset to 000b. |
| 8     | Extended Tag Field<br>Enable            | RW    | Does not apply to PCI Express Switch. Returns '0' when read.<br>Reset to 0b.   |
| 9     | Phantom Function<br>Enable              | RW    | Does not apply to PCI Express Switch. Returns '0' when read.<br>Reset to 0b.   |
| 10    | Auxiliary (AUX)<br>Power PM Enable      | RWS   | When set, indicates that a device is enabled to draw AUX power independent<br>of PME AUX power.<br>Reset to 0b.  |
| 11    | Enable No Snoop                         | RO    | When set, it permits to set the No Snoop bit in the attribute field of<br>transaction. Since the Switch can not either act as a requester or alter the<br>content of packet it forwards, this bit always returns '0' when read.<br>Reset to 0b.  |
| 14:12 | Max_Read_<br>Request_Size               | RO    | This field sets the maximum Read Request size for the device as a Requester.<br>Since the Switch does not generate read request by itself, these bits are<br>hardwired to 000b.<br>Reset to 000b.  |
| 15    | Reserved                                | RsvdP | Not Support.   |

#### 7.2.103 VC ARBITRATION TABLE REGISTER – OFFSET 170h

The VC arbitration table is a read-write register array that contains a table for VC arbitration. Each table entry allocates four bits, of which three bits are used to represent VC ID and one bit is reserved. A total of 32 entries are used to construct the VC arbitration table. The layout for this register array is shown below.

| 31 - 28 | 27 - 24 | 23 - 20 | 19 - 16 | 15 - 12 | 11 - 8 | 7 - 4 | 3 - 0 | Byte Location |
|---------|---------|---------|---------|---------|--------|-------|-------|---------------|
| Phase   | Phase   | Phase   | Phase   | Phase   | Phase  | Phase | Phase | 00h           |

Table 7-1 Register Array Layout for VC Arbitration

# 7.2.104 PORT ARBITRATION TABLE REGISTER (0) and (1) – OFFSET 180h and 1C0h

The Port arbitration table is a read-write register array that contains a table for Port arbitration. Each table entry allocates two bits to represent Port Number. The table entry size is dependent on the number of enabled ports (refer to bit 10 and 11 of Port VC capability register 1). The arbitration table contains 128 entries if three or four ports are to be enabled. The following table shows the register array layout for the size of entry equal to two.

| Table | 7-2 Table | Entry | Size in 4 Bits |
|-------|-----------|-------|----------------|
|-------|-----------|-------|----------------|

| 63 - 56 | 55 - 48 | 47 - 40 | 39 - 32 | 31 - 24 | 23 - 16 | 15 - 8  | 7 - 0   | <b>Byte Location</b> |

# 7.2.112 LTR EXTENDED CAPABILITY HEADER – OFFSET 230h (Upstream Port Only)

| BIT   | FUNC TIO N                               | TYPE | DESCRIPTION   |
|-------|--|------|---|
| 15:0  | PCI Express<br>Extended Capability<br>ID | RO   | Read as 0018h to indicate PCI Express Extended Capability ID for LTR Extended Capability. |
| 19:16 | Capability Version                       | RO   | Read as 1h. Indicates PCI-SIG defined PCI Express capability structure version number.    |
| 31:20 | Next Capability ID                       | RO   | Read as 000h. No other ECP registers.   |

#### 7.2.113 MAX SNOOP LATENCY REGISTER – OFFSET 234h (Upstream Port Only)

| BIT   | FUNCTION                   | TYPE  | DESCRIPTION   |  |  |
|-------|----------------------------|-------|---|--|--|
| 9:0   | Max Snoop Latency<br>Value | RW    | .Specifies the maximum snoop latency that a device is permitted to request<br>Reset to 000h.                            |  |  |
| 12:10 | Max Snoop Latency<br>Scale | RW    | This register provides a scale for the value contained within the Maximum<br>Snoop Latency Value field<br>Reset to 000b |  |  |
| 15:13 | Reserved                   | RsvdP | Not Support.  |  |  |

# 7.2.114 MAX NO-SNOOP LATENCY REGISTER – OFFSET 234h (Upstream Port Only)

| BIT   | <b>FUNCTION</b>               | TYPE  | DESCRIPTION  |
|-------|-------------------------------|-------|--|
| 25:16 | Max No-Snoop<br>Latency Value | RW    | .Specifies the maximum no-snoop latency that a device is permitted to request<br>Reset to 000h.                            |
| 28:26 | Max No-Snoop<br>Latency Scale | RW    | This register provides a scale for the value contained within the Maximum<br>No-Snoop Latency Value field<br>Reset to 000b |
| 31:29 | Reserved                      | RsvdP | Not Support.   |

## **8 CLOCK SCHEME**

The built-in Integrated Reference Clock Buffer of the PI7C9X2G303EL supports three reference clock outputs. The clock buffer feature can be enabled and disabled by strapping the CLKBUF\_PD pin.

When CLKBUF\_PD pin is asserted low, the clock buffer is enabled. The clock buffer distributes a single 100MHz reference clock input to three Reference Clock Output Pairs, REFCLKO\_P[2:0] and REFCLKO\_N[2:0]. The clock buffer requires 100MHz differential clock inputs through REFCLKI\_P and REFCLKI\_N Pins as show in the following table.

When CLKBUF\_PD pin is asserted high, the clock buffer is in power down mode and disabled. The 100MHz Reference Clock Output Pairs are disabled, and The PI7C9X2G303EL requires 100MHz differential clock inputs through REFCLKP and REFCLKN Pins as shown in the following table.

 Table 8-1 AC Switching Characteristics

| Symbol                          | Parameters                   | Min. | Typ. | Max. | Unit |
|---------------------------------|------------------------------|------|------|------|------|
| FIN                             | Reference Clock Frequency    |      | 100  |      | MHz  |
| T rise/ T fall                  | Rise and Fall Time in 20-80% | 175  |      | 700  | ps   |
| DT rise/ DT fall                | Rise and Fall Time Variation |      |      | 125  | ps   |
| T <sub>pd</sub>                 | Propagation Delay            | 2.5  |      | 6.5  | ns   |
| V <sub>swing</sub> <sup>1</sup> | Voltage Including Overshoot  | 550  |      | 1150 | mV   |
| $T_{DC}^{2}$                    | Duty Cycle                   | 45   |      | 55   | %    |

Note:

1. Measurement taken from Single Ended waveform.

2. Measurement taken from Differential waveform.

3.In general rule, use ac-coupling when differential input >500mV; use dc-coupling when differential input <400mV, such as LVDS drive with 100 ohm across at the inputs.

## 9 IEEE 1149.1 COMPATIBLE JTAG CONTROLLER

An IEEE 1149.1 compatible Test Access Port (TAP) controller and associated TAP pins are provided to support boundary scan in PI7C9X2G303EL for board-level continuity test and diagnostics. The TAP pins assigned are TCK, TDI, TDO, TMS and TRST\_L. All digital input, output, input/output pins are tested except TAP pins.

### 9.1 INSTRUCTION REGISTER

The IEEE 1149.1 Test Logic consists of a TAP controller, an instruction register, and a group of test data registers including Bypass and Boundary Scan registers. The TAP controller is a synchronous 16-state machine driven by the Test Clock (TCK) and the Test Mode Select (TMS) pins. An independent power on reset circuit is provided to ensure the machine is in TEST LOGIC RESET state at power-up.

PI7C9X2G303EL implements a 5-bit Instruction register to control the operation of the JTAG logic. The defined instruction codes are shown in the following table. Those bit combinations that are not listed are equivalent to the BYPASS (1111) instruction.

| Instruction  | Operation Code (binary) | Register Selected | Operation   |
|--------------|-------------------------|-------------------|---|
| EXTEST       | 00000                   | Boundary Scan     | Drives / receives off-chip test data  |
| SAMPLE       | 00001                   | Boundary Scan     | Samples inputs / pre-loads outputs  |
| HIGHZ        | 00101                   | Bypass            | Tri-states output and I/O pins except TDO pin   |
| CLAMP        | 00100                   | Bypass            | Drives pins from boundary-scan register and selects Bypass register for shifts            |
| IDCODE       | 01100                   | Device ID         | Accesses the Device ID register, to read manufacturer ID, part number, and version number |
| BYPASS       | 11111                   | Bypass            | Selected Bypass Register  |
| INT_SCAN     | 00010                   | Internal Scan     | Scan test   |
| PHY_TEST_SIG | 01001                   | Private           | Private   |
| MEM_BIST     | 01010                   | Memory BIST       | Memory BIST test  |

#### **Table 9-1 Instruction Register Codes**

#### 9.2 BYPASS REGISTER

The required bypass register (one-bit shift register) provides the shortest path between TDI and TDO when a bypass instruction is in effect. This allows rapid movement of test data to and from other components on the board. This path can be selected when no test operation is being performed on the PI7C9X2G303EL.

#### 9.3 DEVICE ID REGISTER

This register identifies Pericom as the manufacturer of the device and details the part number and revision number for the device.

#### Table 9-2 JTAG Device ID Register

| Bit   | Туре | Value            | Description                                |
|-------|------|------------------|--|
| 31-28 | RO   | 0001             | Version number                             |
| 27-12 | RO   | 0000010100001000 | Last 4 digits (hex) of the die part number |
| 11-1  | RO   | 01000111111      | Pericom identifier assigned by JEDEC       |
| 0     | RO   | 1                | Fixed bit equal to 1'b1                    |

## 9.4 BOUNDARY SCAN REGISTER

The boundary scan register has a set of serial shift-register cells. A chain of boundary scan cells is formed by connected the internal signal of the PI7C9X2G303EL package pins. The VDD, VSS, and JTAG pins are not in the boundary scan chain. The input to the shift register is TDI and the output from the shift register is TDO. There are 4 different types of boundary scan cells, based on the function of each signal pin.

The boundary scan register cells are dedicated logic and do not have any system function. Data may be loaded into the boundary scan register master cells from the device input pins and output pin-drivers in parallel by the mandatory SAMPLE and EXTEST instructions. Parallel loading takes place on the rising edge of TCK.

## 9.5 JTAG BOUNDARY SCAN REGISTER ORDER

| Boundary Scan   |              |               |          |                        |
|-----------------|--------------|---------------|----------|------------------------|
| Register Number | Pin Name     | Ball Location | Туре     | Tri-state Control Cell |
| 0               | DWNRST_L[1]  | F1            | Output2  |                        |
| 1               | DWNRST_L[2]  | J3            | Output2  |                        |
| 2               |              |               | Internal |                        |
| 3               | TEST1        | N3            | Input    |                        |
| 4               | PERST_L      | M1            | Input    |                        |
| 5               | TEST2        | T1            | Input    |                        |
| 6               | TEST3        | V1            | Birdir   | 12                     |
| 7               | VC1_EN       | W3            | Birdir   | 12                     |

## **10 POWER MANAGEMENT**

The PI7C9X2G303EL supports D0, D1, D2, D3-hot, and D3-cold Power States. The PCI Express Physical Link Layer of the PI7C9X2G303EL device supports the PCI Express Link Power Management with L0, L0s, L1, L2/L3 ready and L3 Power States.

During the transition from D3-hot to D3-cold state, the main power supplies of VDDC and VDDR are turned off to save power while keeping the VDDCAUX and VAUX with the auxiliary power supplies to maintain all necessary information to be restored to the full power D0 state. PI7C9X2G303EL has been designed to have sticky registers that are powered by auxiliary power supplies. PI7C9X2G303EL forwards power management messages to the upstream Switches or root complex.

PI7C9X2G303EL also supports ASPM (Active State Power Management) to facilitate the link power saving.

# **11 POWER SEQUENCE**

As long as PERST# is active, all PCI Express functions are held in reset. The main supplies ramp up to their specified levels (3.3V). Sometime during this stabilization time, the REFCLK starts and stabilizes. After there has been time (100 ms) for the power and clock to become stable, PERST# is deasserted high and the PCI Express functions can start up.

It is recommended to power up the I/O voltage (3.3V) first and then the core voltage (1.0V) or power up I/O voltage and core voltage simultaneously for both Aux and Main power rails.

#### Figure 11-1 Initial Power-Up Sequence

Power-down sequence is the reverse of power-up sequence

# 12 ELECTRICAL AND TIMING SPECIFICATIONS

## 12.1 ABSOLUTE MAXIMUM RATINGS

#### Table 12-1 Absolute Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

| Item   | Absolute Max. Rating |
|--|----------------------|
| Storage Temperature (T <sub>store</sub> )  | -65°C to 150°C       |
| Junction Temperature (T <sub>j</sub> )   | 125 °C               |
| Digital core and analog supply voltage to ground potential (VDDC, AVDD and VDDCAUX)          | -0.3v to 1.5v        |
| Digital I/O and analog high supply voltage to ground potential (VDDR, CVDDR, AVDDH and VAUX) | -0.3v to 4.0v        |
| DC input voltage for Digital I/O signals   | -0.3v to 4.0v        |

Note:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

## 12.2 DC SPECIFICATIONS

#### Table 12-2 DC Electrical Characteristics

| Symbol            | Description                           | Min. | Typ. | Max. | Unit  |
|-------------------|---------------------------------------|------|------|------|-------|
| VDDC <sup>1</sup> | Digital Core Power                    | 0.95 | 1.0  | 1.1  |       |
| VDDR              | Digital I/O Power                     | 3.0  | 3.3  | 3.6  |       |
| CVDDR             | Reference Clock Power                 | 3.0  | 3.3  | 3.6  |       |
| VDDCAUX           | Auxiliary Core Power                  | 0.95 | 1.0  | 1.1  |       |
| VAUX              | Auxiliary I/O Power                   | 3.0  | 3.3  | 3.6  |       |
| AVDD              | PCI Express Analog Power              | 0.95 | 1.0  | 1.1  | V     |
| AVDDH             | PCI Express Analog High Voltage Power | 3.0  | 3.3  | 3.6  |       |
| VIH               | Input High Voltage                    | 2.0  |      | 5.5  |       |
| VIL               | Input Low Voltage                     | -0.3 |      | 0.8  |       |
| V <sub>OH</sub>   | Output High Voltage                   | 2.4  |      |      |       |
| V <sub>OL</sub>   | Output Low Voltage                    |      |      | 0.4  |       |
| R <sub>PU</sub>   | Pull-up Resistor                      | 63K  | 92K  | 142K | Ω     |
| R <sub>PD</sub>   | Pull-down Resistor                    | 57K  | 91K  | 159K | 22    |
| $RST #_{Slew}^2$  | PERST_L SlewRate                      | 50   |      |      | mV/ns |

Note:

1. In order to support auxiliary power management fully, it is recommended to have VDDC and VDDCAUX separated.

2. The min. value for PERST\_L Slew Rate is 50 mV/ns, which translates to the requirement that the time for PERST\_L from 0V to 3.3V should be less than 66 ns.

## 12.3 AC SPECIFICATIONS

## 12.4 OPERATING AMBIENT TEMPERATURE

#### Table 12-7 Operating Ambient Temperature

(Above which the useful life may be impaired.)

| Item                                   | Min. | Max. | Units |
|--|------|------|-------|
| Ambient Temperature with power applied | -40  | 85   | °C    |

**Note:** Exposure to high temperature conditions for extended periods of time may affect reliability.

#### **12.5 POWER CONSUMPTION**

#### Table 12-8 Power Consumption

| Active Lane 1.0VDDC    |        | DDC    | 1.0VAUX |      | 1.0AVDD |        | 3.3AVDDH 3.3V |       | DDR    | 3.3VAUX |      | Total |        | Unit     |      |
|------------------------|--------|--------|---------|------|---------|--------|---------------|-------|--------|---------|------|-------|--------|----------|------|
| per Port               | Тур    | Max    | Тур     | Max  | Тур     | Max    | Тур           | Max   | Тур    | Max     | Тур  | Max   | Тур    | Max      | Unit |
| 1/1/1                  | 123.20 | 327.91 | 2.20    | 2.42 | 144.10  | 346.06 | 35.31         | 38.84 | 319.44 | 351.38  | 0.03 | 0.03  | 624.28 | 1,066.65 | mW   |
| 1/1/1, ec <sup>1</sup> | 123.20 | 327.91 | 2.20    | 2.42 | 144.10  | 346.06 | 35.31         | 38.84 | 6.60   | 7.26    | 0.03 | 0.03  | 311.44 | 722.52   | mW   |

Note:

<sup>1</sup>: Use external clock buffer, Disable internal clock buffer.

Test Conditions:

- Typical power measured under the conditions of 1.0V/3.3V power rail without device usage on all downstream ports.

- Maximum power measured under the conditions of 1.1V/3.63V with PCIe2 devices usage on all downstream ports.

- Ambient Temperature at 25°C

- Power consumption in the table is a reference, be affected by various environments, bus traffic and power supply etc.

## **13 PACKAGE INFORMATION**

The package of PI7C9X2G303EL is a 8mm x 8mm aQFN (136 Pin) package. The following are the package information and mechanical dimension:

Figure 13-1 Package outline drawing

Figure 13-2 Package bottom view

## **14 ORDERING INFORMATION**

| Part Number        | Temperature Range        | Package      | Pb-Free & Green |
|--------------------|--------------------------|--------------|-----------------|
| PI7C9X2G303EL□ZXEX | -40° to 85°C             | 136-pin aQFN | Yes             |
|                    | (Industrial Temperature) | 8mm x 8mm    |                 |

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.

#### Как с нами связаться

**Телефон:** 8 (812) 309 58 32 (многоканальный) **Факс:** 8 (812) 320-02-42 **Электронная почта:** <u>org@eplast1.ru</u> **Адрес:** 198099, г. Санкт-Петербург, ул. Калинина, дом 2, корпус 4, литера А.
