

## 16-CHANNEL CONSTANT-CURRENT LED SINK DRIVERS

### FEATURES

- 16 Constant-Current Output Channels
- Output Current Adjusted By External Resistor
- Constant Output Current Range: 5 mA to 120 mA
- Constant Output Current Invariant to Load Voltage Change
- Open-Load, Shorted-Load and Overtemperature Detection
- 256-Step Programmable Global Current Gain
- Excellent Output-Current Accuracy:
  - Between Channels:  $< \pm 6\%$  (Max), 10 mA to 50 mA
  - Between ICs:  $< \pm 6\%$  (Max), 10 mA to 50 mA
- 30-MHz Clock Frequency
- Schmitt-Trigger Input
- 3.3-V or 5-V Supply Voltage
- Thermal Shutdown for Overtemperature Protection
- ESD Performance: 2-kV HBM

### APPLICATIONS

- General LED Lighting Applications
- LED Display Systems
- LED Signage
- Automotive LED Lighting
- White Goods

### DESCRIPTION/ORDERING INFORMATION

The TLC5926/TLC5927 is designed for LED displays and LED lighting applications with open-load, shorted-load, and overtemperature detection, and constant-current control. The TLC5926/TLC5927 contains a 16-bit shift register and data latches, which convert serial input data into parallel output format. At the TLC5926/TLC5927 output stage, 16 regulated-current ports provide uniform and constant current for driving LEDs within a wide range of  $V_F$  (Forward Voltage) variations. Used in systems designed for LED display applications (e.g., LED panels), TLC5926/TLC5927 provides great flexibility and device performance. Users can adjust the output current from 5 mA to 120 mA through an external resistor,  $R_{ext}$ , which gives flexibility in controlling the light intensity of LEDs. TLC5926/TLC5927 is designed for up to 17 V at the output port. The high clock frequency, 30 MHz, also satisfies the system requirements of high-volume data transmission.

The TLC5926/TLC5927 provides a Special Mode in which two functions are included, Error Detection and Current Gain Control. In the TLC5926/TLC5927 there are two operation modes and three phases: Normal Mode phase, Mode Switching transition phase, and Special mode phase. The signal on the multiple-function pin  $\overline{OE}(ED2)$  is monitored, and when an one-clock-wide short pulse appears on  $\overline{OE}(ED2)$ , TLC5926/TLC5927 enters the Mode Switching phase. At this time, the voltage level on  $LE(ED1)$  determines the next mode into which the TLC5926/TLC5927 switches.

In the Normal Mode phase, the serial data is transferred into TLC5926/TLC5927 via SDI, shifted in the shift register, and transferred out via SDO.  $LE(ED1)$  can latch the serial data in the shift register to the output latch.  $\overline{OE}(ED2)$  enables the output drivers to sink current.

In the Special Mode phase, the low-voltage-level signal  $\overline{OE}(ED2)$  can enable output channels and detect the status of the output current, to tell if the driving current level is enough or not. The detected error status is loaded into the 16-bit shift register and shifted out via SDO, along with the CLK signal. The system controller can read the error status to determine whether or not the LEDs are properly lit. In the Special Mode phase, TLC5926/TLC5927 also allows users to adjust the output current level by setting a runtime-programmable Configuration Code. The code is sent into TLC5926/TLC5927 via SDI. The positive pulse of  $LE(ED1)$  latches the code in the shift register into a built-in 8-bit configuration latch, instead of the output latch. The code affects the voltage at R-EXT and controls the output-current regulator. The output current can be adjusted finely by a gain ranging from 1/12 to 127/128 in 256 steps. Therefore, the current skew between ICs can be compensated within less than 1%, and this feature is suitable for white balancing in LED color-display panels.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

**Pin Descriptions**

| PIN NAME             | DESCRIPTION                                                                                                                                                                                                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLK                  | Clock input pin for data shift on rising edge                                                                                                                                                                                                                                                                                      |
| GND                  | Ground pin for control logic and current sink                                                                                                                                                                                                                                                                                      |
| LE(ED1)              | Data strobe input pin<br>Serial data is transferred to the respective latch when LE(ED1) is high. The data is latched when LE(ED1) goes low. Also, a control signal input for an Error Detection mode and Current Adjust mode (See Timing Diagram). LE(ED1) has an internal pulldown.                                              |
| $\overline{OE}(ED2)$ | Output enable pin. When $\overline{OE}(ED2)$ (active) is low, the output drivers are enabled; when $\overline{OE}(ED2)$ is high, all output drivers are turned OFF (blanked). Also, a control signal input for an Error Detection mode and Current Adjust mode (See Timing Diagram). $\overline{OE}(ED2)$ has an internal pull-up. |
| OUT0–OUT15           | Constant-current output pins                                                                                                                                                                                                                                                                                                       |
| R-EXT                | Input pin used to connect an external resistor for setting up all output currents                                                                                                                                                                                                                                                  |
| SDI                  | Serial-data input to the Shift register                                                                                                                                                                                                                                                                                            |
| SDO                  | Serial-data output to the following SDI of next driver IC or to the microcontroller                                                                                                                                                                                                                                                |
| VDD                  | Supply voltage pin                                                                                                                                                                                                                                                                                                                 |

(1) The device has one single error register for all these conditions (one error bit per channel)

## Timing Diagrams

Figure 1. Normal Mode

Truth Table in Normal Mode

| CLK | LE(ED1) | $\overline{OE}(ED2)$ | SDI    | OUT0...OUT15              | SDO     |
|-----|---------|----------------------|--------|---------------------------|---------|
| ↑   | H       | L                    | Dn     | Dn...Dn – 7...Dn – 15     | Dn – 15 |
| ↑   | L       | L                    | Dn + 1 | No change                 | Dn – 14 |
| ↑   | H       | L                    | Dn + 2 | Dn + 2...Dn – 5...Dn – 13 | Dn – 13 |
| ↓   | X       | L                    | Dn + 3 | Dn + 2...Dn – 5...Dn – 13 | Dn – 13 |
| ↓   | X       | H                    | Dn + 3 | off                       | Dn – 13 |

The signal sequence shown in [Figure 2](#) makes the TLC5926/TLC5927 enter Current Adjust and Error Detection mode.

Figure 2. Switching to Special Mode

In the Current Adjust mode, sending the positive pulse of LE(ED1), the content of the shift register (a current adjust code) is written to the 16-bit configuration latch (see Figure 3).

Figure 3. Writing Configuration Code

When the TLC5926/TLC5927 is in the error detection mode, the signal sequence shown in Figure 4 enables a system controller to read error status codes through SDO.

Figure 4. Reading Error Status Code

The signal sequence shown in Figure 5 makes TLC5926/TLC5927 resume the Normal mode. Switching to Normal mode resets all internal Error Status registers. OE (ED2) always enables the output port, whether the TLC5926/TLC5927 enters current adjust mode or not.

Figure 5. Switching to Normal Mode

## Absolute Maximum Ratings

## APPLICATION INFORMATION

### Operating Principles

#### Constant Current

In LED display applications, TLC5926/TLC5927 provides nearly no current variations from channel to channel and from IC to IC. While  $I_{OUT} \leq 50$  mA, the maximum current skew between channels is less than  $\pm 6\%$  and between ICs is less than  $\pm 6\%$ .

#### Adjusting Output Current

TLC5926/TLC5927 scales up the reference current,  $I_{ref}$ , set by the external resistor  $R_{ext}$  to sink a current,  $I_{out}$ , at each output port. Users can follow the below formulas to calculate the target output current  $I_{OUT,target}$  in the saturation region:

$$V_{R-EXT} = 1.26 \text{ V} \times VG$$

$I_{ref} = V_{R-EXT}/R_{ext}$ , if another end of the external resistor  $R_{ext}$  is connected to ground.

$$I_{OUT,target} = I_{ref} \times 15 \times 3^{CM-1}$$

Where  $R_{ext}$  is the resistance of the external resistor connected to the R-EXT terminal, and  $V_{R-EXT}$  is the voltage of R-EXT, which is controlled by the programmable voltage gain (VG), which is defined by the Configuration Code. The Current Multiplier (CM) determines that the ratio  $I_{OUT,target}/I_{ref}$  is 15 or 5. After power on, the default value of VG is  $127/128 = 0.992$ , and the default value of CM is 1, so that the ratio  $I_{OUT,target}/I_{ref} = 15$ . Based on the default VG and CM.

$$V_{R-EXT} = 1.26 \text{ V} \times 127/128 = 1.25 \text{ V}$$

$$I_{OUT,target} = (1.25 \text{ V}/R_{ext}) \times 15$$

Therefore, the default current is approximately 52 mA at 360  $\Omega$  and 26 mA at 720  $\Omega$ . The default relationship after power on between  $I_{OUT,target}$  and  $R_{ext}$  is shown in [Figure 11](#).

**Figure 11. Default Relationship Curve Between  $I_{OUT,target}$  and  $R_{ext}$**

## Operation Phases

### Operation Mode Switching

In order to switch between its two modes, TLC5926/TLC5927 monitors the signal  $\overline{OE}(ED2)$ . When a one-clock-wide pulse of  $\overline{OE}(ED2)$  appears, TLC5926/TLC5927 enters the two-clock-period transition phase, the Mode Switching phase. After power on, the default operation mode is the Normal Mode (see Figure 12).

**Figure 12. Mode Switching**

As shown in Figure 12, once a one-clock-wide short pulse (101) of  $\overline{OE}(ED2)$  appears, TLC5926/TLC5927 enters the Mode Switching phase. At the fourth rising edge of CLK, if LE(ED1) is sampled as voltage high, TLC5926/TLC5927 switches to Special mode; otherwise, it switches to Normal mode. The signal LE(ED1) between the third and the fifth rising edges of CLK cannot latch any data. Its level is used only to determine into which mode to switch. However, the short pulse of  $\overline{OE}(ED2)$  can still enable the output ports. During mode switching, the serial data can still be transferred through SDI and shifted out from SDO.

#### NOTES:

1. The signal sequence for the mode switching may be used frequently to ensure that the TLC5926/TLC5927 is in the proper mode.
2. The 1 and 0 on the LE(ED1) signal are sampled at the rising edge of CLK. The X means its level does not affect the result of mode switching mechanism.
3. After power on, the default operation mode is Normal mode.

### Normal Mode Phase

Serial data is transferred into TLC5926/TLC5927 via SDI, shifted in the Shift Register, and output via SDO. LE(ED1) can latch the serial data in the Shift Register to the Output Latch.  $\overline{OE}(ED2)$  enables the output drivers to sink current. These functions differ only as described in Operation Mode Switching, in which case, a short pulse triggers TLC5926/TLC5927 to switch the operation mode. However, as long as LE(ED1) is high in the Mode Switching phase, TLC5926/TLC5927 remains in the Normal mode, as if no mode switching occurred.

### Special Mode Phase

In the Special mode, as long as  $\overline{OE}(ED2)$  is not low, the serial data is shifted to the Shift Register via SDI and shifted out via SDO, as in the Normal mode. However, there are two differences between the Special Mode and the Normal Mode, as shown in the following sections.

### Reading Error Status Code in Special Mode

When  $\overline{OE}(ED2)$  is pulled low while in Special mode, error detection and load error status codes are loaded into the Shift Register, in addition to enabling output ports to sink current. Figure 13 shows the timing sequence for error detection. The 0 and 1 signal levels are sampled at the rising edge of each CLK. At least three zeros must be sampled at the voltage-low signal  $\overline{OE}(ED2)$ . Immediately after the second 0 is sampled, the data input source of the Shift Register changes to the 16-bit parallel Error Status Code register, instead of from the serial data on SDI. Normally, the error status codes are generated at least 2  $\mu$ s after the falling edge of  $\overline{OE}(ED2)$ . The occurrence of the third or later 0 saves the detected error status codes into the Shift Register. Therefore, when  $\overline{OE}(ED2)$  is low, the serial data cannot be shifted into TLC5926/TLC5927 via SDI. When  $\overline{OE}(ED2)$  is pulled high, the data input source of the Shift Register is changed back to SDI. At the same time, the output ports are disabled and the error detection is completed. Then, the error status codes saved in the Shift Register can be shifted out via SDO bit-by-bit along with CLK, as well as the new serial data can be shifted into TLC5926/TLC5927 via SDI.

While in Special mode, the TLC5926/TLC5927 cannot simultaneously transfer serial data and detect LED load error status.

Figure 13. Reading Error Status Code

### Writing Configuration Code in Special Mode

When in Special mode, the active high signal LE(ED1) latches the serial data in the Shift Register to the Configuration Latch, instead of the Output Latch. The latched serial data is used as the Configuration Code.

The code is stored until power off or the Configuration Latch is rewritten. As shown in Figure 14, the timing for writing the Configuration Code is the same as the timing in the Normal Mode to latching output channel data. Both the Configuration Code and Error Status Code are transferred in the common 16-bit Shift Register. Users must pay attention to the sequence of error detection and current adjustment to avoid the Configuration Code being overwritten by Error Status Code.

Figure 14. Writing Configuration Code

## Open-Circuit Detection Principle

The LED Open-Circuit Detection compares the effective current level  $I_{OUT}$  with the open load detection threshold current  $I_{OUT,Th}$ . If  $I_{OUT}$  is below the  $I_{OUT,Th}$  threshold, the TLC5926/TLC5927 detects an open-load condition. This error status can be read as an error status code in the Special mode. For open-circuit error detection, a channel must be on.

**Table 1. Open-Circuit Detection**

| STATE OF OUTPUT PORT | CONDITION OF OUTPUT CURRENT     | ERROR STATUS CODE            | MEANING                |
|----------------------|---------------------------------|------------------------------|------------------------|
| Off                  | $I_{OUT} = 0 \text{ mA}$        | 0                            | Detection not possible |
| On                   | $I_{OUT} < I_{OUT,Th}^{(1)}$    | 0                            | Open circuit           |
|                      | $I_{OUT} \geq I_{OUT,Th}^{(1)}$ | Channel n error status bit 1 | Normal                 |

(1)  $I_{OUT,Th} = 0.5 \times I_{OUT,target}$  (typical)

## Short-Circuit Detection Principle (TLC5927 Only)

The LED short-circuit detection compares the effective voltage level  $V_{OUT}$  with the shorted-load detection threshold voltages  $V_{OUT,TTh}$  and  $V_{OUT,RTh}$ . If  $V_{OUT}$  is above the  $V_{OUT,TTh}$  threshold, the TLC5927 detects an shorted-load condition. If the  $V_{OUT}$  is below  $V_{OUT,RTh}$  threshold, no error is detected and the error bit is reset. This error status can be read as an error status code in the Special mode. For short-circuit error detection, a channel must be on.

**Table 2. Short-Circuit Detection**

| STATE OF OUTPUT PORT | CONDITION OF OUTPUT VOLTAGE   | ERROR STATUS CODE            | MEANING                |
|----------------------|-------------------------------|------------------------------|------------------------|
| Off                  | $I_{OUT} = 0 \text{ mA}$      | 0                            | Detection not possible |
| On                   | $V_{OUT} < V_{OUT,TTh}^{(1)}$ | 0                            | Short circuit          |
|                      | $V_{OUT} < V_{OUT,RTh}^{(1)}$ | Channel n error status bit 1 | Normal                 |

(1)  $I_{OUT,Th} = 0.5 \times I_{OUT,target}$  (typical)

## Overtemperature Detection and Shutdown

The TLC5926/TLC5927 is equipped with a global overtemperature sensor and 16 individual, channel-specific overtemperature sensors.

- When the global sensor reaches the trip temperature, all output channels are shutdown, and the error status is stored in the internal Error Status register of every channel. After shutdown, the channels automatically restart after cooling down, if the control signal (output latch) remains on. The stored error status is not reset after cooling down and can be read out as the error status code in the Special mode.
- When one of the channel-specific sensors reaches trip temperature, only the affected output channel is shut down, and the error status is stored only in the internal Error Status register of the affected channel. After shutdown, the channel automatically restarts after cooling down, if the control signal (output latch) remains on. The stored error status is not reset after cooling down and can be read out as error status code in the Special mode.

For channel-specific overtemperature error detection, a channel must be on.

The error status code is reset when the TLC5926/TLC5927 returns to Normal mode.

**Table 3. Overtemperature Detection<sup>(1)</sup>**

| STATE OF OUTPUT PORT     | CONDITION                            | ERROR STATUS CODE              | MEANING                   |
|--------------------------|--------------------------------------|--------------------------------|---------------------------|
| Off                      | $I_{OUT} = 0 \text{ mA}$             | 0                              |                           |
| On                       | $T_j < T_{j,trip} \text{ global}$    | 1                              | Normal                    |
| On → all channels<br>Off | $T_j > T_{j,trip} \text{ global}$    | All error status bits = 0      | Global overtemperature    |
| On                       | $T_j < T_{j,trip} \text{ channel n}$ | 1                              | Normal                    |
| On → Off                 | $T_j > T_{j,trip} \text{ channel n}$ | Channel n error status bit = 0 | Channel n overtemperature |

(1) The global shutdown threshold temperature is approximately 170°C.

## 16-Bit Configuration Code and Current Gain

Bit definition of the Configuration Code in the Configuration Latch is shown in [Table 4](#).

**Table 4. Bit Definition of 8-Bit Configuration Code**

|         | Bit 0 | Bit 1 | Bit 2 | Bit 3 | Bit 4 | Bit 5 | Bit 6 | Bit 7 | Bit 8–15   |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|------------|
| Meaning | CM    | HC    | CC0   | CC1   | CC2   | CC3   | CC4   | CC5   | Don't care |
| Default | 1     | 1     | 1     | 1     | 1     | 1     | 1     | 1     | X          |

Bit 7 is first sent into TLC5926/TLC5927 via SDI. Bits 1 to 7 {HC, CC[0:5]} determine the voltage gain (VG) that affects the voltage at R-EXT and indirectly affects the reference current,  $I_{ref}$ , flowing through the external resistor at R-EXT. Bit 0 is the Current Multiplier (CM) that determines the ratio  $I_{OUT,target}/I_{ref}$ . Each combination of VG and CM gives a specific Current Gain (CG).

- VG: the relationship between {HC,CC[0:5]} and the voltage gain is calculated as shown below:  

$$VG = (1 + HC) \times (1 + D/64) / 4$$

$$D = CC0 \times 2^5 + CC1 \times 2^4 + CC2 \times 2^3 + CC3 \times 2^2 + CC4 \times 2^1 + CC5 \times 2^0$$
Where HC is 1 or 0, and D is the binary value of CC[0:5]. So, the VG could be regarded as a floating-point number with 1-bit exponent HC and 6-bit mantissa CC[0:5]. {HC,CC[0:5]} divides the programmable voltage gain VG into 128 steps and two sub-bands:  
Low voltage sub-band (HC = 0):  $VG = 1/4 \sim 127/256$ , linearly divided into 64 steps  
High voltage sub-band (HC = 1):  $VG = 1/2 \sim 127/128$ , linearly divided into 64 steps
- CM: In addition to determining the ratio  $I_{OUT,target}/I_{ref}$ , CM limits the output current range.  
High Current Multiplier (CM = 1):  $I_{OUT,target}/I_{ref} = 15$ , suitable for output current range  $I_{OUT} = 10 \text{ mA}$  to  $120 \text{ mA}$ .  
Low Current Multiplier (CM = 0):  $I_{OUT,target}/I_{ref} = 5$ , suitable for output current range  $I_{OUT} = 5 \text{ mA}$  to  $40 \text{ mA}$
- CG: The total Current Gain is defined as the following.  

$$V_{R-EXT} = 1.26 \text{ V} \times VG$$

$$I_{ref} = V_{R-EXT}/R_{ext}$$
, if the external resistor,  $R_{ext}$ , is connected to ground.  

$$I_{OUT,target} = I_{ref} \times 15 \times 3^{CM-1} = 1.26 \text{ V}/R_{ext} \times VG \times 15 \times 3^{CM-1} = (1.26 \text{ V}/R_{ext} \times 15) \times CG$$

$$CG = VG \times 3^{CM-1}$$
Therefore, CG = (1/12) to (127/128) divided into 256 steps.

### Examples

- Configuration Code {CM, HC, CC[0:5]} = {1,1,111111}  
 $VG = 127/128 = 0.992$  and  $CG = VG \times 3^0 = VG = 0.992$
- Configuration Code = {1,1,000000}  
 $VG = (1 + 1) \times (1 + 0/64)/4 = 1/2 = 0.5$ , and  $CG = 0.5$
- Configuration Code = {0,0,000000}  
 $VG = (1 + 0) \times (1 + 0/64)/4 = 1/4$ , and  $CG = (1/4) \times 3^{-1} = 1/12$

After power on, the default value of the Configuration Code {CM, HC, CC[0:5]} is {1,1,111111}. Therefore,  $VG = CG = 0.992$ . The relationship between the Configuration Code and the Current Gain is shown in [Figure 15](#).

Figure 15. Current Gain vs Configuration Code

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

---

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

DW (R-PDSO-G24)

PLASTIC SMALL OUTLINE

- NOTES:
- All linear dimensions are in inches (millimeters). Dimensioning and tolerancing per ASME Y14.5M-1994.
  - This drawing is subject to change without notice.
  - Body dimensions do not include mold flash or protrusion not to exceed 0.006 (0,15).
  - Falls within JEDEC MS-013 variation AD.

DW (R-PDSO-G24)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Refer to IPC7351 for alternate board design.
  - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525
  - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

DBQ (R-PDSO-G24)

PLASTIC SMALL-OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in inches (millimeters).
  - B. This drawing is subject to change without notice.
  - C. Body dimensions do not include mold flash or protrusion not to exceed 0.006 (0,15) per side.
  - D. Falls within JEDEC MO-137 variation AE.

DBQ (R-PDSO-G24)

PLASTIC SMALL OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
  - D. Publication IPC-7351 is recommended for alternate designs.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.

PWP (R-PDSO-G24)

PowerPAD™ PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Body dimensions do not include mold flash or protrusions. Mold flash and protrusion shall not exceed 0.15 per side.
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
  - E. Falls within JEDEC MO-153

PowerPAD is a trademark of Texas Instruments.

## PWP (R-PDSO-G24) PowerPAD™ SMALL PLASTIC OUTLINE

### THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

4206332-29/AC 07/12

NOTE: A. All linear dimensions are in millimeters

B. Exposed tie strap features may not be present.

PowerPAD is a trademark of Texas Instruments

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46C and to discontinue any product or service per JESD48B. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.

**TI E2E Community** [e2e.ti.com](http://e2e.ti.com)

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
