

## ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

### SYSTEM FEATURES

Up to 240 MHz ARM Cortex-M4 with floating-point unit  
24-channel analog front end (AFE) with 16-bit ADCs  
128K Byte to 384K Byte zero-wait-state L1 SRAM with  
16K Byte L1 cache

Up to 2M Byte flash memory

Single 3.3 V power supply

Package Options:

176-lead (24 mm × 24 mm) LQFP package

120-lead (14 mm × 14 mm) LQFP package

212-ball (19 mm × 19 mm) BGA package

Static memory controller (SMC) with asynchronous memory  
interface that supports 8-bit and 16-bit memories

Enhanced PWM units

Four 3<sup>rd</sup>/4<sup>th</sup> order SINC filter pairs for glueless connection of  
sigma-delta modulators

Hardware-based harmonic analysis engine

10/100 Ethernet MAC with IEEE 1588v2 support

Full Speed USB on-the-go (OTG)

Two CAN (controller area network) 2.0B interfaces

Three UART ports

Two serial peripheral interface (SPI-compatible) ports

Three/four synchronous serial ports

Eight 32-bit GP timers, three capture timing units

Four encoder interfaces, 2 with frequency division

One TWI unit, fully compatible with I<sup>2</sup>C bus standard

Lightweight security

### ANALOG FRONT END

Two 16-bit SAR ADCs with up to 24 multiplexed inputs,  
supporting dual simultaneous conversion in 380 ns (16-bit,  
no missing codes)

ADC controller (ADCC) and DAC controller (DACC)

Two 12-bit DACs

Two 2.5 V precision voltage reference outputs

(For details, see [ADC/DAC Specifications on Page 68](#))

## GENERAL DESCRIPTION

The ADSP-CM40xF family of mixed-signal control processors is based on the ARM® Cortex-M4™ processor core with floating-point unit operating at frequencies up to 240 MHz and integrating up to 384 kB of SRAM memory, 2 MB of flash memory, accelerators and peripherals optimized for motor control and photo-voltaic (PV) inverter control and an analog module consisting of two 16-bit SAR ADCs and two 12-bit DACs. The ADSP-CM40xF family operates from a single voltage supply (VDD\_EXT/VDD\_ANA), generating its own internal voltage supplies using internal voltage regulators and an external pass transistor.

This family of mixed-signal control processors offers low static power consumption and is produced with a low power and low voltage design methodology, delivering world class processor and ADC performance with lower power consumption.

By integrating a rich set of industry-leading system peripherals and memory (shown in Table 1), the ADSP-CM40xF mixed-signal control processors are the platform of choice for next-generation applications that require RISC programmability, advanced communications and leading-edge signal processing in one integrated package. These applications span a wide array of markets including power/motor control, embedded industrial, instrumentation, medical and consumer.

Each ADSP-CM40xF family member contains the following modules.

- 8 GP timers with PWM output
- 3-phase PWM units with up to 4 output pairs per unit
- 2 CAN modules
- 1 two-wire interface (TWI) module
- 3 UARTs
- 1 ADC controller (ADCC) to control on-chip ADCs
- 1 DAC controller (DACC) to control on-chip DACs
- 4 Sinus Cardinalis (SINC) filter pairs
- 1 harmonic analysis engine (HAE)
- 2 SPI (1 connected to internal SPI flash memory)
- 3 half-SPORTs
- 1 watchdog timer unit
- 3 capture timer units
- 1 cyclic redundancy check (CRC)

Table 1 provides the additional product features shown by model.

Table 1. ADSP-CM4 0xF Family Product Features

| Generic                 | ADSP-CM402F                   |                   | ADSP-CM403F       |                   | ADSP-CM407F                    |                   |                   | ADSP-CM408F       |                   | ADSP-CM409F       |                   |

## ANALOG FRONT END

The mixed-signal controllers contain two ADCs and two DACs. Control of these data converters is simplified by a powerful on-chip analog-to-digital conversion controller (ADCC) and a digital-to-analog conversion controller (DACC). The ADCC and DACC are integrated seamlessly into the software programming model, and they efficiently manage the configuration and real-time operation of the ADCs and DACs.

For technical details, see [ADC/DAC Specifications on Page 68](#).

The ADCC provides the mechanism to precisely control execution of timing and analog sampling events on the ADCs. The ADCC supports two-channel (one each—ADC0, ADC1) simultaneous sampling of ADC inputs and can deliver 16 channels of ADC data to memory in 3  $\mu$ s. Conversion data from the ADCs may be either routed via DMA to memory, or to a destination register via the processor. The ADCC can be configured so that the two ADCs sample and convert both analog inputs

simultaneously or at different times and may be operated in asynchronous or synchronous modes. The best performance can be achieved in synchronous mode.

Likewise, the DACC interfaces to two DACs and has purpose of managing those DACs. Conversion data to the DACs may be either routed from memory through DMA, or from a source register via the processor.

Functional operation and programming for the ADCC and DACC are described in detail in the *ADSP-CM40x Mixed-Signal Control Processor with ARM Cortex-M4 Hardware Reference*.

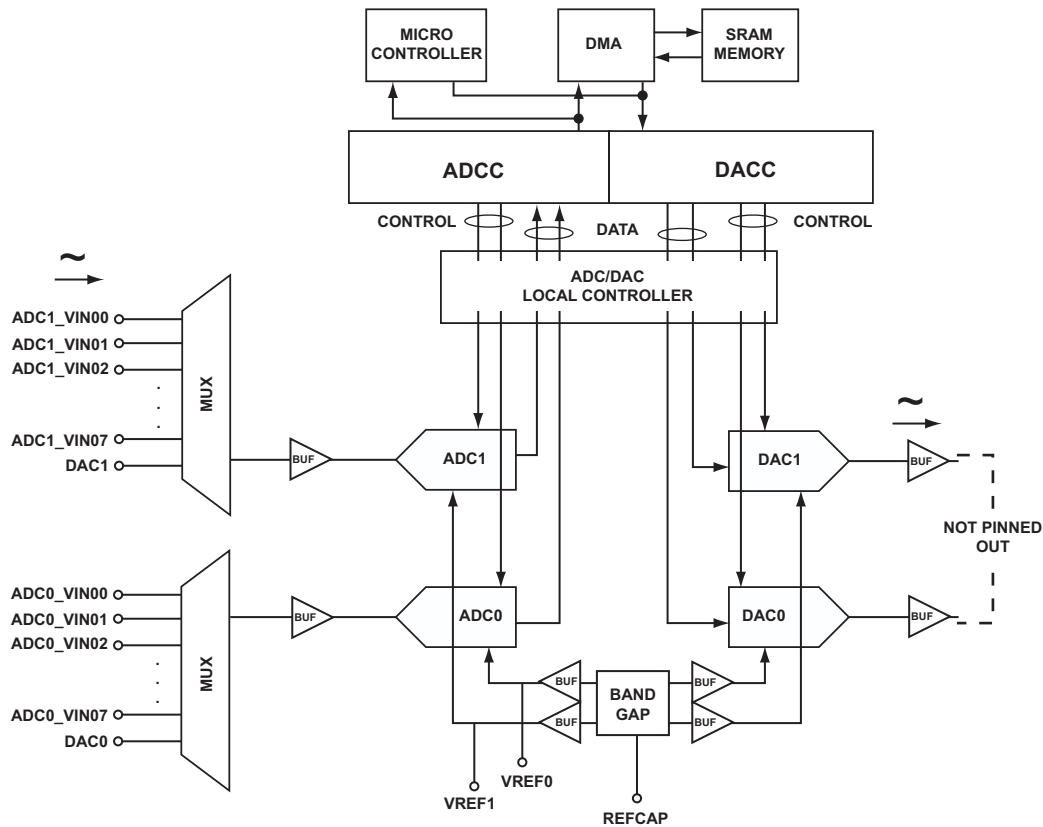

ADC and DAC features and performance specifications differ by processor model. Simplified block diagrams of the ADCC/DACC and the ADC/DAC are shown in [Figure 2](#) and [Figure 3](#).

NOTE: DAC0 AND DAC1 CAN BE MUX SELECTED THROUGH AN INTERNAL PATH WITHIN THE CHIP. SEE THE HARDWARE REFERENCE MANUAL FOR PROGRAMMING DETAIL.

NOTE: DAC0 AND DAC1 CAN BE MUX SELECTED THROUGH AN INTERNAL PATH WITHIN THE CHIP. SEE THE HARDWARE REFERENCE MANUAL FOR PROGRAMMING DETAIL.

Figure 3. ADSP-CM407F/ADSP-CM408F Analog Subsystem Block Diagram

## Considerations for Best Converter Performance

As with any high performance analog/digital circuit, to achieve best performance, good circuit design and board layout practices should be followed. The power supply and its noise bypass (decoupling), ground return paths and pin connections, and analog/digital routing channel paths and signal shielding, are all of first-order consideration. For application hints on design best practice, see [Figure 4](#) and the *ADSP-CM40x Mixed-Signal Control Processor with ARM Cortex-M4 Hardware Reference*. For more information about the VREG circuit, see [Figure 9](#).

## ADC Module

The ADC module contains two 16-bit, high speed, low power successive approximation register (SAR) ADCs, allowing for dual simultaneous sampling with each ADC preceded by a 12-channel multiplexer. See [ADC Specifications on Page 68](#) for detailed performance specifications. Input multiplexers enable conversion of up to a combined 26 analog input sources to the ADCs (12 analog inputs plus 1 DAC loopback input per ADC).

The voltage input range requirement for those analog inputs is from 0 V to 2.5 V. All analog inputs are of single-ended design. As with all single-ended inputs, signals from high impedance sources are the most difficult to measure, and depending on the

electrical environment, may require an external buffer circuit for signal conditioning (see [Figure 5](#)). An on-chip pre-buffer between the multiplexer and ADC reduces the need for additional signal conditioning external to the processor. Additionally, each ADC has an on-chip 2.5 V reference that can be overdriven when an external voltage reference is preferred.

## DAC Module

The DAC is a 12-bit, low power, string DAC design. The output of the DAC is buffered, and can drive an R/C load to either ground or VDD\_ANA. See [DAC Specifications on Page 70](#) for detailed performance specifications. It should be noted that on some models of the processor, the DAC outputs are not pinned out. However, these outputs are always available as one of the multiplexed inputs to the ADCs. This feature may be useful for functional self-check of the converters.

Note: On the ADSP-CM402F/CM403F/CM409F processors, the DAC output is available to the ADC as channel 12; whereas on the ADSP-CM407F/CM408F processors, the DAC output is available to the ADC as Channel 8.

## ARM CORTEX-M4 CORE

The ARM Cortex-M4, core shown in [Figure 6](#), is a 32-bit reduced instruction set computer (RISC). It uses 32-bit buses for instruction and data. The length of the data can be 8 bits, 16 bits, or 32 bits. The length of the instruction word is 16 or 32 bits. The controller has the following features.

### Cortex-M4 Architecture

- Thumb-2 ISA technology
- DSP and SIMD extensions
- Single cycle MAC (Up to  $32 \times 32 + 64 \rightarrow 64$ )
- Hardware divide instructions
- Single-precision FPU
- NVIC interrupt controller (129 interrupts and 16 priorities)
- Memory protection unit (MPU)
- Full CoreSight™ debug, trace, breakpoints, watchpoints, and cross-triggers

### Microarchitecture

- 3-stage pipeline with branch speculation
- Low-latency interrupt processing with tail chaining

### Configurable For Ultra Low Power

- Deep sleep mode, dynamic power management
- Programmable clock generator unit

### EmbeddedICE

EmbeddedICE™ provides integrated on-chip support for the core. The EmbeddedICE module contains the breakpoint and watchpoint registers that allow code to be halted for debugging purposes. These registers are controlled through the JTAG test port.

When a breakpoint or watchpoint is encountered, the processor halts and enters debug state. Once in a debug state, the processor registers can be inspected as well as the Flash/EE, SRAM, and memory-mapped registers.

Figure 6. Cortex-M4 Block Diagram

## PROCESSOR INFRASTRUCTURE

The following sections provide information on the primary infrastructure components of the ADSP-CM40xF processors.

### DMA Controllers (DDEs)

The processor contains 17 independent and concurrently operating peripheral DMA channels plus two MDMA streams. DDE Channel 0 to Channel 16 are for peripherals and Channel 17 to Channel 20 are for MDMA.

### System Event Controller (SEC)

The SEC manages the enabling and routing of system fault sources through its integrated fault management unit.

### Trigger Routing Unit (TRU)

The TRU provides system-level sequence control without core intervention. The TRU maps trigger masters (generators of triggers) to trigger slaves (receivers of triggers). Slave endpoints can be configured to respond to triggers in various ways. Common applications enabled by the TRU include:

- Initiating the ADC sampling periodically in each PWM period or based on external events
- Automatically triggering the start of a DMA sequence after a sequence from another DMA channel completes
- Software triggering
- Synchronization of concurrent activities

### Pin Interrupts (PINT)

Every port pin on the processor can request interrupts in either an edge-sensitive or a level-sensitive manner with programmable polarity. Interrupt functionality is decoupled from GPIO operation. Six system-level interrupt channels (PINT0 to PINT5) are reserved for this purpose. Each of these interrupt channels can manage up to 32 interrupt pins. The assignment from pin to interrupt is not performed on a pin-by-pin basis. Rather, groups of eight pins (half ports) can be flexibly assigned to interrupt channels.

Every pin interrupt channel features a special set of 32-bit memory-mapped registers that enable half-port assignment and interrupt management. This includes masking, identification, and clearing of requests. These registers also enable access to the respective pin states and use of the interrupt latches, regardless of whether the interrupt is masked or not. Most control registers feature multiple MMR address entries to write-one-to-set or write-one-to-clear them individually.

### General-Purpose I/O (GPIO)

Each general-purpose port pin can be individually controlled by manipulation of the port control, status, and interrupt registers:

- GPIO direction control register—Specifies the direction of each individual GPIO pin as input or output.
- GPIO control and status registers —A write one to modify mechanism allows any combination of individual GPIO pins to be modified in a single instruction, without affecting the level of any other GPIO pins.

- GPIO interrupt mask registers—Allow each individual GPIO pin to function as an interrupt to the processor. GPIO pins defined as inputs can be configured to generate hardware interrupts, while output pins can be triggered by software interrupts.
- GPIO interrupt sensitivity registers—Specify whether individual pins are level- or edge-sensitive and specify—if edge-sensitive—whether just the rising edge or both the rising and falling edges of the signal are significant.

### Pin Multiplexing

The processor supports a flexible multiplexing scheme that multiplexes the GPIO pins with various peripherals. A maximum of five peripherals plus GPIO functionality is shared by each GPIO pin. All GPIO pins have a bypass path feature—that is, when the output enable and the input enable of a GPIO pin are both active, the data signal before the pad driver is looped back to the receive path for the same GPIO pin.

For more information, see:

- [ADSP-CM402F/ADSP-CM403F GPIO Multiplexing for 120-Lead LQFP on Page 27.](#)
- [ADSP-CM407F/ADSP-CM408F GPIO Multiplexing for 176-Lead LQFP on Page 37.](#)
- [ADSP-CM409F GPIO Multiplexing for 212-Ball BGA on Page 48.](#)

## MEMORY ARCHITECTURE

The internal and external memory of the ADSP-CM40xF processor is shown in [Figure 7](#) and described in the following sections.

### ARM Cortex-M4 Memory Subsystem

The memory map of the ADSP-CM40xF family is based on the Cortex-M4 model from ARM. By retaining the standardized memory mapping, it becomes easier to port applications across M4 platforms. Only the physical implementation of memories inside the model differs from other vendors.

ADSP-CM40xF application development is typically based on memory blocks across CODE/SRAM and external memory regions. Sufficient internal memory is available via internal SRAM and internal flash. Additional external memory devices may be interfaced via the SMC asynchronous memory port, as well as through the SPI0 serial memory interface.

### Code Region

Accesses in this region (0x0000\_0000 to 0x1FFF\_FFFF) are performed by the core on its ICODE and DCODE interfaces, and they target the memory and cache resources within the Cortex-M4F platform integration component.

- **Boot ROM.** A 32K byte boot ROM executed at system reset. This space supports read-only access by the M4F core only. Note that ROM memory contents cannot be modified by the user.

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

- **Internal SRAM Code Region.** This memory space contains the application instructions and literal (constant) data which must be executed real time. It supports read/write access by the M4F core and read/write DMA access by system devices. Internal SRAM can be partitioned between CODE and DATA (SRAM region in M4 space) in 64K byte blocks. Access to this region occurs at core clock speed, with no wait states.
- **Integrated Flash.** This contains the 2M byte flash memory space interfaced via the SPI2 port of the processor. This memory space contains the application instructions and literal (constant) data. Reads from flash memory are directly cached via internal code cache. Direct memory-mapped reads are permitted through SPI memory-mapped protocol. Internal flash memory ships from the factory in an erased state except for Sector 0 and Sector 1 of the main flash array. Sector 0 and Sector 1 of the main flash array ships from the factory in an unknown state. An erase operation should be performed prior to programming this sector.
- **Internal Code Cache.** A zero-wait-state code cache SRAM memory is available internally (not visible in the memory map) to cache instruction access from internal flash as well as any externally connected serial flash and asynchronous memory.
- **MEM-X/MEM-Y.** These are virtual memory blocks which are used as cacheable memory for the code cache. No physical memory device resides inside these blocks. The application code must be compiled against these memory blocks to utilize the cache.

## SRAM Region

Accesses in this region (0x2000\_0000 to 0x3FFF\_FFFF) are performed by the ARM Cortex-M4F core on its SYS interface. The SRAM region of the core can otherwise act as a data region for an application.

- **Internal SRAM Data Region.** This space can contain read/write data. Internal SRAM can be partitioned between CODE and DATA (SRAM region in M4 space) in 64K byte blocks. Access to this region occurs at core clock speed, with no wait states. It supports read/write access by the M4F core and read/write DMA access by system devices. It supports exclusive memory accesses via the global exclusive access monitor within the Cortex-M4F platform. Bit-banding support is also available.

## System Memory Spaces

- **External SPI Flash.** Up to 16M byte of external serial quad flash memory optionally connected to the SPI0 port of the processor. Reads from flash memory are directly cached via internal code cache. Direct memory-mapped reads are permitted via SPI memory-mapped protocol.
- **System MMRs.** Various system MMRs reside in this region. Bit-banding support is available for MMRs.

Figure 7. ADSP-CM40xF Memory Map

## External Asynchronous Parallel Flash/RAM

- **L2 Asynchronous Memory.** Up to 32M byte × 4 banks of external memory can be optionally connected to the asynchronous memory port (SMC). Code execution from these memory blocks can be optionally cached via internal code cache. Direct R/W data access is also possible.

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

## System Region

Accesses in this region (0xE000\_0000 to 0xF7FF\_FFFF) are performed by the ARM Cortex-M4F core on its SYS interface, and are handled within the Cortex-M4F platform. The MPU may be programmed to limit access to this space to privileged mode only.

- **CoreSight ROM.** The ROM table entries point to the debug components of the processor.
- **ARM PPB Peripherals.** This space is defined by ARM and occupies the bottom 256K byte of the SYS region (0xE000\_0000 to 0xE004\_0000). The space supports read/write access by the M4F core to the ARM core's internal peripherals (MPU, ITM, DWT, FPB, SCS, TPIU, ETM) and the CoreSight ROM. It is not accessible by system DMA.
- **Platform Control Registers.** This space has registers within the Cortex-M4F platform integration component that control the ARM core, its memory, and the code cache. It is accessible by the M4F core via its SYS port (but is not accessible by system DMA).

## Static Memory Controller (SMC)

The SMC can be programmed to control up to four banks of external memories or memory-mapped devices, with very flexible timing parameters. On ADSP-CM407F/CM408F/CM409F processors, each bank can occupy a 32M byte segment regardless of the size of the device used.

## Booting (BOOT)

The processor has several mechanisms for automatically loading internal and external memory after a reset. The boot mode is defined by the SYS\_BMODE input pins dedicated for this purpose. There are two categories of boot modes. In master boot modes, the processor actively loads data from a serial memory. In slave boot modes, the processor receives data from external host devices.

The boot modes are shown in [Table 2](#). These modes are implemented by the SYS\_BMODE bits of the RCU\_CTL register and are sampled during power-on resets and software-initiated resets.

Table 2. Boot Modes

| SYS_BMODE[1:0]<br>Setting | Description   |
|---------------------------|---|
| 00                        | No Boot/Idle. The processor does not boot. Rather the boot kernel executes an IDLE instruction. |
| 01                        | Flash Boot. Boot from integrated Flash memory through the SPI2.                                 |
| 10                        | SPI Slave Boot. Boot through the SPI0 peripheral configured as a slave.                         |
| 11                        | UART Boot. Boot through the UART0 peripheral configured as a slave.                             |

## SYSTEM ACCELERATION

The following sections describe the system acceleration blocks of the ADSP-CM40xF processors.

### Harmonic Analysis Engine (HAE)

The harmonic analysis engine (HAE) block receives 8 kHz input samples from two source signals whose frequencies are between 45 Hz and 65 Hz. The HAE will then process the input samples and produce output results. The output results consist of power quality measurements of the fundamental and up to 12 selectable harmonics.

### Sinus Cardinalis Filter (SINC)

The SINC module processes four bit streams using a pair of configurable SINC filters for each bitstream. The purpose of the primary SINC filter of each pair is to produce the filtered and decimated output for the pair. The output may be decimated to any integer rate between 8 and 256 times lower than the input rate. Greater decimation allows greater removal of noise and therefore greater ENOB.

Optional additional filtering outside the SINC module may be used to further increase ENOB. The primary SINC filter output is accessible through transfer to processor memory, or to another peripheral, via DMA.

Each of the four channels is also provided with a low-latency secondary filter with programmable positive and negative over-range detection comparators. These limit detection events can be used to interrupt the core, generate a trigger, or signal a system fault.

## SECURITY FEATURES

The processor provides lightweight security functionality which protects sensitive data and IP located in the internal flash memory. It includes password-protected slave boot modes (SPI and UART), as well as password-protected JTAG/SWD debug interfaces. One of the safeguards of the security feature is the ability to perform bulk erase of the entire flash memory. Another security measure provides the ability to control which boot modes are allowed so as to protect the flash contents from untrusted or non-secure boot modes. Programs can enable or disable security features depending upon the secure header configured in internal flash memory.

### CAUTION

This product includes security features that can be used to protect embedded nonvolatile memory contents and prevent execution of unauthorized code. When security is enabled on this device (either by the ordering party or the subsequent receiving parties), the ability of Analog Devices to conduct failure analysis on returned devices is limited. Contact Analog Devices for details on the failure analysis limitations for this device.

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

## PROCESSOR RELIABILITY FEATURES

The processor provides the following features which can enhance or help achieve certain levels of system safety and reliability. While the level of safety is mainly dominated by system considerations, the following features are provided to enhance robustness.

### **Multi-Parity-Bit-Protected L1 Memories**

In the processor's SRAM and cache L1 memory space, each word is protected by multiple parity bits to detect the single event upsets that occur in all RAMs.

### **Cortex MPU**

The MPU divides the memory map into a number of regions, and allows the system programmer to define the location, size, access permissions, and memory attributes of each region. It supports independent attribute settings for each region, overlapping regions, and export of memory attributes to the system.

For more information, refer to the ARM Infocenter web page.

### **System Protection Unit (SPU)**

All system resources and L2 memory banks can be controlled by either the processor core, memory-to-memory DMA, or the debug unit. A system protection unit (SPU) enables write accesses to specific resources that are locked to a given master. System protection is enabled in greater granularity for some modules through a global lock concept.

### **Watchpoint Protection**

The primary purpose of watchpoints and hardware breakpoints is to serve emulator needs. When enabled, they signal an emulator event whenever user-defined system resources are accessed or a core executes from user-defined addresses. Watchdog events can be configured such that they signal the events to the core or to the SEC.

### **Software Watchdog**

The on-chip watchdog timer can provide software-based supervision of the ADSP-CM40xF core.

### **Signal Watchdogs**

The eight general-purpose timers feature two modes to monitor off-chip signals. The watchdog period mode monitors whether external signals toggle with a period within an expected range. The watchdog width mode monitors whether the pulse widths of external signals are in an expected range. Both modes help to detect incorrect undesired toggling (or lack thereof) of system-level signals.

### **Oscillator Watchdog**

The oscillator watchdog monitors the external clock oscillator, and can detect the absence of clock as well as incorrect harmonic oscillation. The oscillator watchdog detection signal is routed to the fault management portion of the system event controller.

### **Low-Latency Sinc Filter Over-range Detection**

The SINC filter units provide a low-latency secondary filter with programmable positive and negative limit detectors for each input channel. These may be used to monitor an isolation ADC bitstream for overrange or underrange conditions with a filter group delay as low as 0.7  $\mu$ s on a 10 MHz bitstream. The secondary SINC filter events can be used to interrupt the core, to trigger other events directly in hardware using the trigger routing unit (TRU), or to signal the fault management unit of a system fault.

### **Up/Down Count Mismatch Detection**

The GP counter can monitor external signal pairs, such as request/grant strobes. If the edge count mismatch exceeds the expected range, the up/down counter can flag this to the processor or to the system event controller (SEC).

### **Fault Management**

The fault management unit is part of the system event controller (SEC). Most system events can be defined as faults. If defined as such, the SEC forwards the event to its fault management unit which may automatically reset the entire device for reboot, or simply toggle the `SYS_FAULT` output pin to signal off-chip hardware. Optionally, the fault management unit can delay the action taken via a keyed sequence, to provide a final chance for the core to resolve the crisis and to prevent the fault action from being taken.

## ADDITIONAL PROCESSOR PERIPHERALS

The processor contains a rich set of peripherals connected to the core via several concurrent high-bandwidth buses, providing flexibility in system configuration as well as excellent overall system performance (see [Figure 1](#), Block Diagram).

The processor contains high speed serial and parallel ports, an interrupt controller for flexible management of interrupts from the on-chip peripherals or external sources, and power management control functions to tailor the performance and power characteristics of the processor and system to many application scenarios.

The following sections describe additional peripherals that were not described in the previous sections.

### **Timers**

The processor includes several timers which are described in the following sections.

#### **General-Purpose Timers (TIMER)**

The general-purpose (GP) timer unit provides eight general-purpose programmable timers. Each timer has an external pin that can be configured either as a pulse width modulator (PWM) or timer output, as an input to clock the timer, or as a mechanism for measuring pulse widths and periods of external events. These timers can be synchronized to an external clock input on the `TM0_ACLKx` pins, an external signal on the `TM0_CLK` input pin, or to the internal `SCLK`.

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

The timer unit can be used in conjunction with the UARTs and the CAN controller to measure the width of the pulses in the data stream to provide a software auto-baud detect function for the respective serial channels.

The timer can generate interrupts to the processor core, providing periodic events for synchronization to either the system clock or to external signals. Timer events can also trigger other peripherals via the TRU (for instance, to signal a fault).

## Watchdog Timer (WDT)

The core includes a 32-bit timer, which may be used to implement a software watchdog function. A software watchdog can improve system availability by forcing the processor to a known state, via generation of a general-purpose interrupt, if the timer expires before being reset by software. The programmer initializes the count value of the timer, enables the appropriate interrupt, then enables the timer. Thereafter, the software must reload the counter before it counts to zero from the programmed value. This protects the system from remaining in an unknown state where software, which would normally reset the timer, has stopped running due to an external noise condition or software error. Optionally, the fault management unit (FMU) can directly initiate the processor reset upon the watchdog expiry event.

## Capture Timer (CPTMR)

The processor includes three instances of capture timers (CPTMR) to capture total on time. Each capture timer captures total on time of the input signal between two leading edges of the input trigger signal. Capture timer inputs to all the timers come from external pins and the input trigger signal comes from trigger routing unit (TRU).

The core of the timer is a 32-bit counter which is reset at leading edge of the trigger and counts when the input signal level is active. The total on time of the input signal is captured from the counter at the leading edge of the trigger pulse. Capture timer can generate data interrupts to the processor core at leading edges of trigger pulses and status interrupts to indicate counter overflow condition.

## 3-Phase Pulse Width Modulator Unit (PWM)

The pulse width modulator (PWM) unit provides duty cycle and phase control capabilities to a resolution of one system clock cycle (SCLK). The heightened precision PWM (HPPWM) module provides increased performance to the PWM unit by increasing its resolution by several bits, resulting in enhanced precision levels. Additional features include:

- 16-bit center-based PWM generation unit
- Programmable PWM pulse width
- Single/double update modes
- Programmable dead time and switching frequency
- Twos-complement implementation which permits smooth transition to full on and full off states
- Dedicated asynchronous PWM trip signal

The eight PWM output signals (per PWM unit) consist of four high-side drive signals and four low-side drive signals. The polarity of a generated PWM signal can be set with software, so that either active high or active low PWM patterns can be produced.

Each PWM block integrates a flexible and programmable 3-phase PWM waveform generator that can be programmed to generate the required switching patterns to drive a 3-phase voltage source inverter for ac induction motor (ACIM) or permanent magnet synchronous motor (PMSM) control. In addition, the PWM block contains special functions that considerably simplify the generation of the required PWM switching patterns for control of the electronically commutated motor (ECM) or permanent magnet synchronous motor (PMSM) control. Software can enable a special mode for switched reluctance motors (SRM).

Each PWM unit features a dedicated asynchronous trip pin which (when brought low) instantaneously places all PWM outputs in the off state.

## Serial Ports (SPORTs)

The synchronous serial ports provide an inexpensive interface to a wide variety of digital and mixed-signal peripheral devices such as Analog Devices, Inc., audio codecs, ADCs, and DACs. The serial ports are made up of two data lines per direction, a clock, and frame sync. The data lines can be programmed to either transmit or receive and each data line has a dedicated DMA channel.

Serial port data can be automatically transferred to and from on-chip memory/external memory via dedicated DMA channels. For full-duplex operation, two half SPORTs can work in conjunction with clock and frame sync signals shared internally through the SPMUX block. In some operation modes, SPORT supports gated clock.

Serial ports operate in six modes:

- Standard DSP serial mode
- Multichannel (TDM) mode
- I<sup>2</sup>S mode
- Packed I<sup>2</sup>S mode
- Left-justified mode
- Right-justified mode

## General-Purpose Counters

The 32-bit counter can operate in general-purpose up/down count modes and can sense 2-bit quadrature or binary codes as typically emitted by industrial drives or manual thumbwheels. Count direction is either controlled by a level-sensitive input pin or by two edge detectors.

A third counter input can provide flexible zero marker support and can alternatively be used to input the push-button signal of thumb wheels. All three pins have a programmable debouncing circuit.

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

The GP counter can also support a programmable M/N frequency scaling of the CNT\_CUD and CNT\_CDG pins onto output pins in quadrature encoding mode.

Internal signals forwarded to each general-purpose timer enable these timers to measure the intervals between count events. Boundary registers enable auto-zero operation or simple system warning by interrupts when programmable count values are exceeded.

## **Serial Peripheral Interface Ports (SPI)**

The processor contains the SPI-compatible port that allows the processor to communicate with multiple SPI-compatible devices.

In its simplest mode, the SPI interface uses three pins for transferring data: two data pins master output-slave input and master input-slave output (SPI\_MOSI and SPI\_MISO) and a clock pin, SPI\_CLK. A SPI chip select input pin ( $\overline{\text{SPI\_SS}}$ ) lets other SPI devices select the processor, and three SPI chip select output pins (SPI\_SELn) let the processor select other SPI devices. The SPI select pins are reconfigured general-purpose I/O pins. Using these pins, the SPI provides a full-duplex, synchronous serial interface, which supports both master and slave modes and multimaster environments.

In a multimaster or multislave SPI system, the MOSI and MISO data output pins can be configured to behave as open drain outputs (using the ODM bit) to prevent contention and possible damage to pin drivers. An external pull-up resistor is required on both the MOSI and MISO pins when this option is selected.

When ODM is set and the SPI is configured as a master, the MOSI pin is three-stated when the data driven out on MOSI is a logic high. The MOSI pin is not three-stated when the driven data is a logic low. Similarly, when ODM is set and the SPI is configured as a slave, the MISO pin is three-stated if the data driven out on MISO is a logic high.

The SPI port's baud rate and clock phase/polarities are programmable, and it has integrated DMA channels for both transmit and receive data streams.

## **Universal Asynchronous Receiver/Transmitter Ports (UART)**

The processor provides full-duplex universal asynchronous receiver/transmitter (UART) ports, which are fully compatible with PC-standard UARTs. Each UART port provides a simplified UART interface to other peripherals or hosts, supporting full-duplex, DMA-supported, asynchronous transfers of serial data. A UART port includes support for five to eight data bits, and none, even, or odd parity. Optionally, an additional address bit can be transferred to interrupt only addressed nodes in multi-drop bus (MDB) systems. A frame is terminated by one, one and a half, two or two and a half stop bits.

The UART ports support automatic hardware flow control through the clear to send (CTS) input and request to send (RTS) output with programmable assertion FIFO levels.

To help support the local interconnect network (LIN) protocols, a special command causes the transmitter to queue a break command of programmable bit length into the transmit buffer. Similarly, the number of stop bits can be extended by a programmable inter-frame space.

The capabilities of the UARTs are further extended with support for the infrared data association (IrDA<sup>®</sup>) serial infrared physical layer link specification (SIR) protocol.

## **2-Wire Controller Interface (TWI)**

The processor includes a 2-wire interface (TWI) module for providing a simple exchange method of control data between multiple devices. The TWI module is compatible with the widely used I<sup>2</sup>C bus standard. The TWI module offers the capabilities of simultaneous master and slave operation and support for both 7-bit addressing and multimedia data arbitration. The TWI interface utilizes two pins for transferring clock (TWI\_SCL) and data (TWI\_SDA) and supports the protocol at speeds up to 400k bits/sec. The TWI interface pins are compatible with 5 V logic levels.

Additionally, the TWI module is fully compatible with serial camera control bus (SCCB) functionality for easier control of various CMOS camera sensor devices.

## **Controller Area Network (CAN)**

The CAN controller implements the CAN 2.0B (active) protocol. This protocol is an asynchronous communications protocol used in both industrial and automotive control systems. The CAN protocol is well suited for control applications due to its capability to communicate reliably over a network. This is because the protocol incorporates CRC checking, message error tracking, and fault node confinement.

The CAN controller offers the following features:

- 32 mailboxes (8 receive only, 8 transmit only, 16 configurable for receive or transmit).
- Dedicated acceptance masks for each mailbox.
- Additional data filtering on first two bytes.
- Support for both the standard (11-bit) and extended (29-bit) identifier (ID) message formats.
- Support for remote frames.
- Active or passive network support.
- Interrupts, including: TX complete, RX complete, error and global.

An additional crystal is not required to supply the CAN clock, as the CAN clock is derived from a system clock through a programmable divider.

## **10/100 Ethernet MAC (EMAC)**

The processor can directly connect to a network by way of an embedded fast Ethernet media access controller (MAC) that supports both 10-BaseT (10M bits/sec) and 100-BaseT (100M bits/sec) operation. The 10/100 Ethernet MAC peripheral on the processor is fully compliant to the IEEE 802.3-2002 standard. It

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

provides programmable features designed to minimize supervision, bus use, or message processing by the rest of the processor system.

Some standard features are:

- Support for RMIIC protocols for external PHYs
- Full-duplex and half-duplex modes
- Media access management (in half-duplex operation)
- Flow control
- Station management: generation of MDC/MDIO frames for read-write access to PHY registers

Some advanced features are:

- Automatic checksum computation of IP header and IP payload fields of Rx frames
- Independent 32-bit descriptor-driven receive and transmit DMA channels
- Frame status delivery to memory through DMA, including frame completion semaphores for efficient buffer queue management in software
- Tx DMA support for separate descriptors for MAC header and payload to eliminate buffer copy operations
- Convenient frame alignment modes
- 47 MAC management statistics counters with selectable clear-on-read behavior and programmable interrupts on half maximum value
- Advanced power management
- Magic packet detection and wakeup frame filtering
- Support for 802.3Q tagged VLAN frames
- Programmable MDC clock rate and preamble suppression

## IEEE 1588 Support

The IEEE 1588 standard is a precision clock synchronization protocol for networked measurement and control systems. The processor includes hardware support for IEEE 1588 with an integrated precision time protocol synchronization engine. This engine provides hardware assisted time stamping to improve the accuracy of clock synchronization between PTP nodes. The main features of the engine are:

- Support for both IEEE 1588-2002 and IEEE 1588-2008 protocol standards
- 64-bit hardware assisted time stamping for transmit and receive frames capable of up to 10 ns resolution
- Identification of PTP message type, version, and PTP payload in frames sent directly over Ethernet and transmission of the status
- Coarse and fine correction methods for system time update
- Alarm features: target time can be set to interrupt when system time reaches target time

- Pulse-Per-Second (PPS) output for physical representation of the system time. Flexibility to control the pulse-per-second output signal including control of start time, stop time, PPS output width and interval
- Automatic detection and time stamping of PTP messages over IPv4, IPv6, and Ethernet packets
- Multiple input clock sources (SCLK, RMIIC clock, external clock)
- Auxiliary snapshot to time stamp external events

## USB 2.0 On-the-Go (OTG) Dual-Role Device Controller

The USB 2.0 on-the go (OTG) dual-role device controller provides a low-cost connectivity solution for the growing adoption of this bus standard in industrial applications, as well as consumer mobile devices such as cell phones, digital still cameras, and MP3 players. The USB 2.0 controller is a full-speed-only (FS) interface that allows these devices to transfer data using a point-to-point USB connection without the need for a PC host. The module can operate in a traditional USB peripheral-only mode as well as the host mode presented in the OTG supplement to the USB 2.0 specification.

## CLOCK AND POWER MANAGEMENT

The processor provides three operating modes, each with a different performance/power profile. Control of clocking to each of the processor peripherals also reduces power consumption. See [Table 3](#) for a summary of the power settings for each mode.

Table 3. Power Settings

| Mode       | CGU PLL  | CGU PLL Bypassed | f <sub>CCLK</sub> | f <sub>SCLK</sub> | Core Power |
|------------|----------|------------------|-------------------|-------------------|------------|
| Full On    | Enabled  | No               | Enabled           | Enabled           | On         |
| Active     | Enabled  | Yes              | Enabled           | Enabled           | On         |
|            | Disabled | Yes              | Enabled           | Enabled           | On         |
| Deep Sleep | Disabled | —                | Disabled          | Disabled          | On         |

## Crystal Oscillator (SYS\_XTAL)

The processor can be clocked by an external crystal (see [Figure 8](#)), a sine wave input, or a buffered, shaped clock derived from an external clock oscillator. If an external clock is used, it should be a TTL compatible signal and must not be halted, changed, or operated below the specified frequency during normal operation. This signal is connected to the processor's SYS\_CLKIN pin. When an external clock is used, the SYS\_XTAL pin must be left unconnected. Alternatively, because the processor includes an on-chip oscillator circuit, an external crystal may be used.

For fundamental frequency operation, use the circuit shown in [Figure 8](#). A parallel-resonant, fundamental frequency, micro-processor grade crystal is connected across the SYS\_CLKIN and XTAL pins. The on-chip resistance between SYS\_CLKIN and the XTAL pin is in the 500 kΩ range. Further parallel resistors are typically not recommended.

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

NOTE: VALUES MARKED WITH \* MUST BE CUSTOMIZED, DEPENDING ON THE CRYSTAL AND LAYOUT. ANALYZE CAREFULLY. FOR FREQUENCIES ABOVE 33 MHz, THE SUGGESTED CAPACITOR VALUE OF 18pF SHOULD BE TREATED AS A MAXIMUM, AND THE SUGGESTED RESISTOR VALUE SHOULD BE REDUCED TO 0 Ω.

Figure 8. External Crystal Connection

The two capacitors and the 330 Ω series resistor shown in Figure 8 fine tune phase and amplitude of the sine frequency. The capacitor and resistor values shown in Figure 8 are typical values only. The capacitor values are dependent upon the crystal manufacturers' load capacitance recommendations and the PCB physical layout. The resistor value depends on the drive level specified by the crystal manufacturer. The user should verify the customized values based on careful investigations on multiple devices over temperature range.

A third-overtone crystal can be used for frequencies above 25 MHz. The circuit is then modified to ensure crystal operation only at the third overtone by adding a tuned inductor circuit as shown in Figure 8. A design procedure for third-overtone operation is discussed in detail in application note (EE-168) "Using Third Overtone Crystals with the ADSP-218x DSP" ([www.analog.com/ee-168](http://www.analog.com/ee-168)).

## Oscillator Watchdog

A programmable oscillator watchdog unit is provided to allow verification of proper startup and harmonic mode of the external crystal. This allows the user to specify the expected frequency of oscillation, and to enable detection of non-oscillation and improper-oscillation faults. These events can be routed to the `SYS_FAULT` output pin and/or to cause a reset of the part.

## Clock Generation Unit (CGU)

The clock generation unit (CGU) generates all on-chip clocks and synchronization signals. Multiplication factors are programmed to the PLLs to define the PLLCLK frequency. Programmable values divide the PLLCLK frequency to generate the core clock (CCLK), the system clocks (SCLK), and the output clock (OCLK). This is illustrated in Figure 10 on Page 64.

Writing to the CGU control registers does not affect the behavior of the PLL immediately. Registers are first programmed with a new value, and the PLL logic executes the changes so that it transitions smoothly from the current conditions to the new ones.

SYS\_CLKIN oscillations start when power is applied to the VDD\_EXT pins. The rising edge of SYS\_HWRST can be applied as soon as all voltage supplies are within specifications (see [Operating Conditions on Page 64](#)), and SYS\_CLKIN oscillations are stable.

## Clock Out/External Clock

A SYS\_CLKOUT output pin has programmable options to output divided-down versions of the on-chip clocks, including USB clocks. By default, the SYS\_CLKOUT pin drives a buffered version of the SYS\_CLKIN input. Clock generation faults (for example PLL unlock) may trigger a reset by hardware.

SYS\_CLKOUT can be used to output one of several different clocks used on the processor. The clocks shown in Table 4 can be outputs from SYS\_CLKOUT.

Table 4. SYS\_CLKOUT Source and Divider Options

| Clock Source        | Divider                     |
|---------------------|-----------------------------|
| CCLK (Core Clock)   | By 4                        |
| OCLK (Output Clock) | Programmable                |
| USBCCLK             | Programmable                |
| CLKBUF              | None, direct from SYS_CLKIN |

## Power Management

As shown in Table 5 and Figure 4 on Page 6, the processor requires three different power domains, VDD\_INT, VDD\_EXT, and VDD\_ANA. By isolating the internal logic of the processor into its own power domain, separate from other I/O, the processor can take advantage of dynamic power management without affecting the other I/O devices. There are no sequencing requirements for the various power domains, but all domains must be powered according to the appropriate Specifications table for processor operating conditions; even if the feature/peripheral is not used.

The dynamic power management feature of the processor allows the processor's core clock frequency ( $f_{CCLK}$ ) to be dynamically controlled.

Table 5. Power Domains

| Power Domain       | V <sub>DD</sub> Range |
|--------------------|-----------------------|
| All Internal Logic | V <sub>DD_INT</sub>   |
| Digital I/O        | V <sub>DD_EXT</sub>   |
| Analog             | V <sub>DD_ANA</sub>   |

The power dissipated by a processor is largely a function of its clock frequency and the square of the operating voltage. For example, reducing the clock frequency by 25% results in a 25% reduction in dynamic power dissipation. For more information on power pins, see [Operating Conditions on Page 64](#).

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

## Full-On Operating Mode—Maximum Performance

In the full-on mode, the PLL is enabled and is not bypassed, providing capability for maximum operational frequency. This is the execution state in which maximum performance can be achieved. The processor core and all enabled peripherals run at full speed.

For more information about PLL controls, see the “Dynamic Power Management” chapter in the *ADSP-CM40x Mixed-Signal Control Processor with ARM Cortex-M4 Hardware Reference*.

## Deep Sleep Operating Mode—Maximum Dynamic Power Savings

The deep sleep mode maximizes dynamic power savings by disabling the clocks to the processor core and to all synchronous peripherals. Asynchronous peripherals may still be running but cannot access internal resources or external memory.

## Voltage Regulation for VDD\_INT

The internal voltage VDD\_INT to the ADSP-CM40xF processors can be generated either by using an on-chip voltage regulator or by an external voltage regulator.

The VDD\_INT of 1.2 V can be generated using the external I/O supply VDD\_VREG of 3.3 V, which is then used to generate VDD\_INT of 1.2 V. Figure 9 shows the external components required to complete the power management system for proper operation. For more details regarding component selection, refer to (EE-361) *ADSP-CM40x Power Supply Transistor Selection Guidelines* ([www.analog.com/ee-361](http://www.analog.com/ee-361)).

The internal voltage regulator can be bypassed and VDD\_INT can be supplied using an external regulator. When an external regulator is used, VDD\_VREG and VREG\_BASE must be tied to ground for zero current consumption.

Figure 9. Internal Voltage Regulator Circuit

## Reset Control Unit (RCU)

Reset is the initial state of the whole processor or of the core and is the result of a hardware or software triggered event. In this state, all control registers are set to their default values and functional units are idle. Exiting a core only reset starts with the core being ready to boot.

The reset control unit (RCU) controls how all the functional units enter and exit reset. Differences in functional requirements and clocking constraints define how reset signals are generated. Programs must guarantee that none of the reset functions puts the system into an undefined state or causes resources to stall.

From a system perspective reset is defined by both the reset target and the reset source as described below.

Target defined:

- Hardware Reset—All functional units are set to their default states without exception. History is lost.
- System Reset—All functional units except the RCU are set to their default states.

Source defined:

- Hardware Reset—The `SYS_HWRST` input signal is asserted active (pulled down).
- System Reset—May be triggered by software (writing to the `RCU_CTL` register) or by another functional unit such as the dynamic power management (DPM) unit or any of the system event controller (SEC), trigger routing unit (TRU), or emulator inputs.
- Trigger request (peripheral).

## SYSTEM DEBUG UNIT (SDU)

The processor includes various features that allow for easy system debug. These are described in the following sections.

### JTAG Debug and Serial Wire Debug Port (SWJ-DP)

SWJ-DP is a combined JTAG-DP and SW-DP that enables either a serial wire debug (SWD) or JTAG probe to be connected to a target. SWD signals share the same pins as JTAG. There is an auto detect mechanism that switches between JTAG-DP and SW-DP depending on which special data sequence is used the emulator pod transmits to the JTAG pins. The SWJ-DP behaves as a JTAG target if normal JTAG sequences are sent to it and as a single wire target if the SW\_DP sequence is transmitted.

### Embedded Trace Macrocell (ETM) and Instrumentation Trace Macrocell (ITM)

The ADSP-CM40xF processors support both embedded trace macrocell (ETM) and instrumentation trace macrocell (ITM). These both offer an optional debug component that enables logging of real-time instruction and data flow within the CPU core. This data is stored and read through special debugger pods that have the trace feature capability. The ITM is a single-data pin feature and the ETM is a 4-data pin feature.

### System Watchpoint Unit (SWU)

The system watchpoint unit (SWU) is a single module which connects to a single system bus and provides for transaction monitoring. One SWU is attached to the bus going to each system slave. The SWU provides ports for all system bus address channel signals. Each SWU contains four match groups of

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

registers with associated hardware. These four SWU match groups operate independently, but share common event (interrupt and trigger) outputs.

## DEVELOPMENT TOOLS

The ADSP-CM40xF processor is supported with a set of highly sophisticated and easy-to-use development tools for embedded applications. For more information, see the Analog Devices website.

## ADDITIONAL INFORMATION

The following publications that describe the ADSP-CM40xF processors (and related processors) can be ordered from any Analog Devices sales office or accessed electronically on our website:

- *ADSP-CM40x Mixed-Signal Control Processor with ARM Cortex-M4 Hardware Reference*
- *ADSP-CM402F/CM403F/CM407F/CM408F/CM409F Anomaly Sheet*

This data sheet describes the ARM Cortex-M4 core and memory architecture used on the ADSP-CM40xF processor, but does not provide detailed programming information for the ARM processor. For more information about programming the ARM processor, visit the ARM Infocenter web page.

The applicable documentation for programming the ARM Cortex-M4 processor include:

- *Cortex<sup>®</sup>-M4 Devices Generic User Guide*
- *CoreSight<sup>™</sup> ETM<sup>™</sup>-M4 Technical Reference Manual*
- *Cortex<sup>®</sup>-M4 Technical Reference Manual*

## RELATED SIGNAL CHAINS

A signal chain is a series of signal-conditioning electronic components that receive input (data acquired from sampling either real-time phenomena or from stored data) in tandem, with the output of one portion of the chain supplying input to the next. Signal chains are often used in signal processing applications to gather and process data or to apply system controls based on analysis of real-time phenomena.

Analog Devices eases signal processing system development by providing signal processing components that are designed to work together well. A tool for viewing relationships between specific applications and related components is available on the [www.analog.com](http://www.analog.com) website.

The application signal chains page in the Circuits from the Lab<sup>®</sup> site (<http://www.analog.com/circuits>) provides:

- Graphical circuit block diagram presentation of signal chains for a variety of circuit types and applications
- Drill down links for components in each chain to selection guides and application information
- Reference designs applying best practice design techniques

## SECURITY FEATURES DISCLAIMER

To our knowledge, the Security Features, when used in accordance with the data sheet and hardware reference manual specifications, provide a secure method of implementing code and data safeguards. However, Analog Devices does not guarantee that this technology provides absolute security.

ACCORDINGLY, ANALOG DEVICES HEREBY DISCLAIMS ANY AND ALL EXPRESS AND IMPLIED WARRANTIES THAT THE SECURITY FEATURES CANNOT BE BREACHED, COMPROMISED, OR OTHERWISE CIRCUMVENTED AND IN NO EVENT SHALL ANALOG DEVICES BE LIABLE FOR ANY LOSS, DAMAGE, DESTRUCTION, OR RELEASE OF DATA, INFORMATION, PHYSICAL PROPERTY, OR INTELLECTUAL PROPERTY.

## ADSP-CM40xF DETAILED SIGNAL DESCRIPTIONS

Table 6 provides a detailed description of each pin.

Table 6. ADSP-CM40xF Detailed Signal Description

| Signal Name  | Direction | Description  |
|--------------|-----------|--|
| ADC_VINn     | Input     | <b>Channel nn.</b> Single-Ended Analog Input for ADCs. nn = 00 to 11 for each ADC  |
| BYP_An       |           | <b>On-chip Analog Power Regulation Bypass Filter Node for ADC.</b> Connect to decoupling capacitors. n = 0, 1  |
| BYP_D0       |           | <b>On-chip Digital Power Regulation Bypass Filter Node for Analog Subsystem.</b> Connect to decoupling capacitors.   |
| CAN_RX       | Input     | <b>CAN Receive.</b> Typically an external CAN transceiver's RX output.   |
| CAN_TX       | Output    | <b>CAN Transmit.</b> Typically an external CAN transceiver's TX input.   |
| CNT_OUTA     | Output    | <b>Counter Output Divider A.</b> Frequency scaled output in Quadrature encoder mode of GP Counter  |
| CNT_OUTB     | Output    | <b>Counter Output Divider B.</b> Frequency scaled output in Quadrature encoder mode of GP Counter  |
| CNT_DG       | Input     | <b>CNT Count Down and Gate.</b> Depending on the mode of operation this input acts either as a count down signal or a gate signal.<br>Count Down: This input causes the GP counter to decrement.<br>Gate: Stops the GP counter from incrementing or decrementing.              |
| CNT_UD       | Input     | <b>Count Up and Direction.</b> Depending on the mode of operation this input acts either as a count up signal or a direction signal.<br>Count Up: This input causes the GP counter to increment.<br>Direction: Selects whether the GP counter is incrementing or decrementing. |
| CNT_ZM       | Input     | <b>Count Zero Marker.</b> Input that connects to the zero marker output of a rotary device or detects the pressing of a push button.   |
| CPTMR_INn    | Input     | <b>Capture Timer Input Pins.</b> n = 0, 1, 2   |
| DACn_VOUT    | Output    | <b>DAC Output.</b> Analog voltage output. n = 0, 1   |
| ETH_CRSS     | Input     | <b>EMAC Carrier Sense.</b> Multiplexed on alternate clock cycles.<br>CRS: Asserted by the PHY when either the transmit or receive medium is not idle. De-asserted when both are idle.<br>RXDV: Asserted by the PHY when the data on RXDn is valid.                             |
| ETH_MDC      | Output    | <b>EMAC Management Channel Clock.</b> Clocks the MDC input of the PHY.   |
| ETH_MDIO     | I/O       | <b>EMAC Management Channel Serial Data.</b> Bidirectional data bus for PHY control.  |
| ETH_PTPAUXIN | Input     | <b>EMAC PTP Auxiliary Trigger Input.</b> Assert this signal to take an auxiliary snapshot of the time and store it in the auxiliary time stamp FIFO.   |
| ETH_PTPCLKIN | Input     | <b>EMAC PTP Clock Input.</b> Optional external PTP clock input.  |
| ETH_PTPPPS   | Output    | <b>EMAC PTP Pulse-Per-Second Output.</b> When the Advanced Time Stamp feature is enabled, this signal is asserted based on the PPS mode selected. Otherwise, PTPPPS is asserted every time the seconds counter is incremented.   |
| ETH_REFCLK   | Input     | <b>EMAC Reference Clock.</b> Externally supplied Ethernet clock.   |
| ETH_RXDn     | Input     | <b>EMAC Receive Data n.</b> Receive data bus. n = 0, 1   |
| ETH_TXDn     | Output    | <b>EMAC Transmit Data n.</b> Transmit data bus. n = 0, 1   |
| ETH_TXEN     | I/O       | <b>EMAC Transmit Enable.</b> When asserted indicates that the data on TXDn is valid.   |
| JTG_SWCLK    | I/O       | <b>Serial Wire Clock.</b> Clocks data into and out of the target during debug.   |
| JTG_SWDIO    | I/O       | <b>Serial Wire Data IO.</b> Sends and receives serial data to and from the target during debug.  |
| JTG_SWO      | Output    | <b>Serial Wire Out.</b> Provides trace data to the emulator.   |
| JTG_TCK      | Input     | <b>JTAG Clock.</b> JTAG test access port clock.  |
| JTG_TDI      | Input     | <b>JTAG Serial Data In.</b> JTAG test access port data input.  |
| JTG_TDO      | Output    | <b>JTAG Serial Data Out.</b> JTAG test access port data output.  |
| JTG_TMS      | Input     | <b>JTAG Mode Select.</b> JTAG test access port mode select.  |

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

**Table 6. ADSP-CM40xF Detailed Signal Description (Continued)**

| Signal Name            | Direction | Description  |
|------------------------|-----------|--|
| JTG_TRST               | Input     | <b>JTAG Reset.</b> JTAG test access port reset.  |
| Px_nn                  | I/O       | <b>Position n.</b> General purpose input/output. See the GP Ports chapter in the processor hardware reference for programming information.   |
| PWM_AH                 | Output    | <b>PWM Channel A High Side.</b> High side drive signal.  |
| PWM_AL                 | Output    | <b>PWM Channel A Low Side.</b> Low side drive signal.  |
| PWM_BH                 | Output    | <b>PWM Channel B High Side.</b> High side drive signal.  |
| PWM_BL                 | Output    | <b>PWM Channel B Low Side.</b> Low side drive signal.  |
| PWM_CH                 | Output    | <b>PWM Channel C High Side.</b> High side drive signal.  |
| PWM_CL                 | Output    | <b>PWM Channel C Low Side.</b> Low side drive signal.  |
| PWM_DH                 | Output    | <b>PWM Channel D High Side.</b> High side drive signal.  |
| PWM_DL                 | Output    | <b>PWM Channel D Low Side.</b> Low side drive signal.  |
| PWM_SYNC               | I/O       | <b>PWM Synchronization signal.</b> This is an input pin when PWM is configured to receive external sync signal. It is an output pin when PWM Sync is generated internally.   |
| PWM_TRIPn              | Input     | <b>PWM Trip Input.</b> When asserted the selected PWM channel outputs are shut down immediately.   |
| REFCAP                 | Analog    | Output of BandGap Generator Filter Node  |
| SINC_CLKn              | Output    | <b>SINC Clock n.</b> n = 0, 1  |
| SINC_Dn                | Input     | <b>SINC Data n.</b> n = 0 to 3   |
| SMC_Ann                | Output    | <b>SMC Address n.</b> Address bus. n = 0 to 24   |
| SMC_ABE $\overline{n}$ | Output    | <b>SMC Byte Enable n.</b> Indicates whether the lower or upper byte of a memory is being accessed. When an asynchronous write is made to the upper byte of a 16-bit memory, SMC_ABE1 = 0 and SMC_ABE0 = 1. When an asynchronous write is made to the lower byte of a 16-bit memory, SMC_ABE1 = 1 and SMC_ABE0 = 0. |
| SMC_AMSn               | Output    | <b>SMC Memory Select n.</b> Typically connects to the chip select of a memory device. n = 0, 1, 2, 3   |
| SMC_AOE                | Output    | <b>SMC Output Enable.</b> Asserts at the beginning of the setup period of a read access.   |
| SMC_ARDY               | Input     | <b>SMC Asynchronous Ready.</b> Flow control signal used by memory devices to indicate to the SMC when further transactions may proceed.  |
| SMC_ARE                | Output    | <b>SMC Read Enable.</b> Asserts at the beginning of a read access.   |
| SMC_AWE                | Output    | <b>SMC Write Enable.</b> Asserts for the duration of a write access period.  |
| SMC_Dnn                | I/O       | <b>SMC Data n.</b> Bidirectional data bus. n = 0 to 15   |
| SPI_CLK                | I/O       | <b>SPI Clock.</b> Input in slave mode, output in master mode.  |
| SPI_D2                 | I/O       | <b>SPI Data 2.</b> Used to transfer serial data in quad mode. Open drain in ODM mode.  |
| SPI_D3                 | I/O       | <b>SPI Data 3.</b> Used to transfer serial data in quad mode. Open drain in ODM mode.  |
| SPI_MISO               | I/O       | <b>SPI Master In, Slave Out.</b> Used to transfer serial data. Operates in the same direction as SPI_MOSI in dual and quad modes. Open drain in ODM mode.  |
| SPI_MOSI               | I/O       | <b>SPI Master Out, Slave In.</b> Used to transfer serial data. Operates in the same direction as SPI_MISO in dual and quad modes. Open drain in ODM mode.  |
| SPI_RDY                | I/O       | <b>SPI Ready.</b> Optional flow signal to hold-off faster masters. Output in slave mode, input in master mode.   |
| SPI_SELn               | Output    | <b>SPI Slave Select Output n.</b> Used in master mode to enable the desired slave.   |
| SPI_SS                 | Input     | <b>SPI Slave Select Input.</b> Slave mode: acts as the slave select input. Master mode: optionally serves as an error detection input for the SPI when there are multiple masters.   |
| SPT_ACLK               | I/O       | <b>SPORT A Channel Clock.</b> Data and frame sync are driven/sampled with respect to this clock. This signal can be either internally or externally generated.   |
| SPT_ADO                | I/O       | <b>SPORT A Channel Data 0.</b> Primary bidirectional data I/O. This signal can be configured as an output to transmit serial data, or as an input to receive serial data.  |
| SPT_AD1                | I/O       | <b>SPORT A Channel Data 1.</b> Secondary bidirectional data I/O. This signal can be configured as an output to transmit serial data, or as an input to receive serial data.  |

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

Table 6. ADSP-CM40xF Detailed Signal Description (Continued)

| Signal Name                     | Direction | Description   |
|---------------------------------|-----------|---|
| SPT_AFS                         | I/O       | <b>SPORT A Channel Frame Sync.</b> The frame sync pulse initiates shifting of serial data. This signal is either generated internally or externally.  |
| SPT_ATDV                        | Output    | <b>SPORT A Channel Transmit Data Valid.</b> This signal is optional and only active when SPORT is configured in multi-channel transmit mode. It is asserted during enabled slots.   |
| SPT_BCLK                        | I/O       | <b>SPORT B Channel Clock.</b> Data and frame sync are driven/sampled with respect to this clock. This signal can be either internally or externally generated.  |
| SPT_BD0                         | I/O       | <b>SPORT B Channel Data 0.</b> Primary bidirectional data I/O. This signal can be configured as an output to transmit serial data, or as an input to receive serial data.   |
| SPT_BD1                         | I/O       | <b>SPORT B Channel Data 1.</b> Secondary bidirectional data I/O. This signal can be configured as an output to transmit serial data, or as an input to receive serial data.   |
| SPT_BFS                         | I/O       | <b>SPORT B Channel Frame Sync.</b> The frame sync pulse initiates shifting of serial data. This signal is either generated internally or externally.  |
| SPT_BTDV                        | Output    | <b>SPORT B Channel Transmit Data Valid.</b> This signal is optional and only active when SPORT is configured in multi-channel transmit mode. It is asserted during enabled slots.   |
| SYS_BMODEn                      | Input     | <b>Boot Mode Control n.</b> Selects the boot mode of the processor. n = 0, 1  |
| SYS_CLKIN                       | Input     | <b>Processor Clock/Crystal Input.</b> Connect to an external clock source or crystal.   |
| SYS_CLKOUT                      | Output    | <b>Processor Clock Output.</b> Outputs internal clocks. Clocks may be divided down. See the CGU chapter in the processor hardware reference for more details.   |
| SYS_DSWAKEn                     | Input     | <b>System Deep Sleep Wakeup inputs.</b> n = 0 to 3  |
| $\overline{\text{SYS\_FAULT}}$  | Output    | <b>System Fault.</b> Indicates system fault.  |
| $\overline{\text{SYS\_HWRST}}$  | Input     | <b>Processor Hardware Reset Control.</b> Resets the device when asserted.   |
| $\overline{\text{SYS\_NMI}}$    | Input     | <b>Non-maskable Interrupt.</b> See the processor hardware and programming references for more details.  |
| $\overline{\text{SYS\_RESOUT}}$ | Output    | <b>Processor Reset Output.</b> Indicates that the device is in the reset state.   |
| SYS_XTAL                        | Output    | <b>System Crystal Output.</b> Drives an external crystal. Must be left unconnected if an external clock is driving CLKIN.   |
| TM_ACIn                         | Input     | <b>GP Timer Alternate Capture Input n.</b> Provides an additional input for GP Timers in WIDCAP, WATCHDOG, and PININT modes. n = 0 to 5   |
| TM_ACLKn                        | Input     | <b>GP Timer Alternate Clock n.</b> Provides an additional time base for use by an individual timer. n = 0 to 5  |
| TM_CLK                          | Input     | <b>GP Timer Clock.</b> Provides an additional global time base for use by all the GP timers.  |
| TM_TMRn                         | I/O       | <b>GP Timer Timer n.</b> The main input/output signal for each timer. n = 0 to 7. In PWM OUT mode, output is driven on this pin. In Width capture mode, it acts as input and Timer measures width and/or period of incoming signal on this pin. In EXTCLK mode, Timer counts number of incoming signal edges on this pin. |
| TRACE_CLK                       | Output    | <b>Embedded Trace Module Clock.</b> Reference clock for the Trace Unit.   |
| TRACE_Dn                        | Output    | <b>Embedded Trace Module Data n.</b> Output data for clocked modes and changes on both edges of TRACE_CLK. n = 0 to 3   |
| TWI_SCL                         | I/O       | <b>TWI Serial Clock.</b> Clock output when master, clock input when slave. Compatible with I <sup>2</sup> C bus standard.   |
| TWI_SDA                         | I/O       | <b>TWI Serial Data.</b> Receives or transmits data. Compatible with I <sup>2</sup> C bus standard.  |
| $\overline{\text{UART\_CTS}}$   | Input     | <b>UART Clear to Send.</b> Input Hardware Flow control signal. Transmitter initiates the transfer only when this signal is active.  |
| $\overline{\text{UART\_RTS}}$   | Output    | <b>UART Request to Send.</b> Output Hardware Flow control signal. Receiver activates this signal when it is ready to receive new transfers.   |
| $\overline{\text{UART\_RX}}$    | Input     | <b>UART Receive.</b> Receive input. Typically connects to a transceiver that meets the electrical requirements of the device being communicated with.   |
| $\overline{\text{UART\_TX}}$    | Output    | <b>UART Transmit.</b> Transmit output. Typically connects to a transceiver that meets the electrical requirements of the device being communicated with.  |
| USB_DM                          | I/O       | <b>USB Data –.</b> Bidirectional differential data line.  |
| USB_DP                          | I/O       | <b>USB Data +.</b> Bidirectional differential data line.  |

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

**Table 6. ADSP-CM40xF Detailed Signal Description (Continued)**

| Signal Name | Direction | Description  |
|-------------|-----------|--|
| USB_ID      | Input     | <b>USB OTG ID.</b> Senses whether the controller is a host or device. This signal is pulled low when an A-type plug is sensed (signifying that the USB controller is the A device), but the input is high when a B-type plug is sensed (signifying that the USB controller is the B device). |
| USB_VBC     | Output    | <b>USB VBUS Control.</b> Controls an external voltage source to supply VBUS when in host mode. May be configured as open drain. Polarity is configurable as well.  |
| USB_VBUS    | I/O       | <b>USB Bus Voltage.</b> Connects to bus voltage in host and device modes.  |
| VREFn       | I/O       | <b>Voltage Reference for ADC.</b> When internal reference is selected for ADC, the VREF pin is used for connecting bypass caps. When external reference is selected, an external reference device should be connected to these pins to supply the external reference voltage. n=0,1.         |
| VREG_BASE   | Output    | <b>Voltage Regulator Base Node.</b> Connected to Base of PNP transistor when using internal VDD_INT reference.   |

## ADSP-CM402F/ADSP-CM403F 120-LEAD LQFP SIGNAL DESCRIPTIONS

The processor's pin definitions are shown in [Table 7](#). The columns in this table provide the following information:

- **Signal Name:** The Signal Name column in the table includes the signal name for every pin and (where applicable) the GPIO multiplexed pin function for every pin.
- **Description:** The Description column in the table provides a verbose (descriptive) name for the signal.
- **General-Purpose Port:** The Port column in the table shows whether or not the signal is multiplexed with other signals on a general-purpose I/O port pin.
- **Pin Name:** The Pin Name column in the table identifies the name of the package pin (at power on reset) on which the signal is located (if a single function pin) or is multiplexed (if a general-purpose I/O pin).

**Table 7. ADSP-CM402F/ADSP-CM403F 120-Lead LQFP Signal Descriptions**

| Signal Name | Description   | Port      | Pin Name   |
|-------------|---|-----------|------------|
| ADC0_VIN00  | Channel 0 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN00 |
| ADC0_VIN01  | Channel 1 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN01 |
| ADC0_VIN02  | Channel 2 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN02 |
| ADC0_VIN03  | Channel 3 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN03 |
| ADC0_VIN04  | Channel 4 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN04 |
| ADC0_VIN05  | Channel 5 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN05 |
| ADC0_VIN06  | Channel 6 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN06 |
| ADC0_VIN07  | Channel 7 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN07 |
| ADC0_VIN08  | Channel 8 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN08 |
| ADC0_VIN09  | Channel 9 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN09 |
| ADC0_VIN10  | Channel 10 Single-Ended Analog Input for ADC0   | Not Muxed | ADC0_VIN10 |
| ADC0_VIN11  | Channel 11 Single-Ended Analog Input for ADC0   | Not Muxed | ADC0_VIN11 |
| ADC1_VIN00  | Channel 0 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN00 |
| ADC1_VIN01  | Channel 1 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN01 |
| ADC1_VIN02  | Channel 2 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN02 |
| ADC1_VIN03  | Channel 3 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN03 |
| ADC1_VIN04  | Channel 4 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN04 |
| ADC1_VIN05  | Channel 5 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN05 |
| ADC1_VIN06  | Channel 6 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN06 |
| ADC1_VIN07  | Channel 7 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN07 |
| ADC1_VIN08  | Channel 8 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN08 |
| ADC1_VIN09  | Channel 9 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN09 |
| ADC1_VIN10  | Channel 10 Single-Ended Analog Input for ADC1   | Not Muxed | ADC1_VIN10 |
| ADC1_VIN11  | Channel 11 Single-Ended Analog Input for ADC1   | Not Muxed | ADC1_VIN11 |
| BYP_A0      | On-chip Analog Power Regulation Bypass Filter Node for ADC0 (see recommended bypass - <a href="#">Figure 4 on Page 6</a> )              | Not Muxed | BYP_A0     |
| BYP_A1      | On-chip Analog Power Regulation Bypass Filter Node for ADC1 (see recommended bypass - <a href="#">Figure 4 on Page 6</a> )              | Not Muxed | BYP_A1     |
| BYP_D0      | On-chip Digital Power Regulation Bypass Filter Node for Analog Subsystem (see recommended bypass - <a href="#">Figure 4 on Page 6</a> ) | Not Muxed | BYP_D0     |
| CAN0_RX     | CAN0 Receive  | B         | PB_15      |
| CAN0_TX     | CAN0 Transmit   | C         | PC_00      |
| CAN1_RX     | CAN1 Receive  | B         | PB_10      |
| CAN1_TX     | CAN1 Transmit   | B         | PB_11      |
| CNT0_DG     | CNT0 Count Down and Gate  | B         | PB_02      |
| CNT0_OUTA   | CNT0 Output Divider A   | B         | PB_13      |

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

## ADSP-CM402F/ADSP-CM403F GPIO MULTIPLEXING FOR 120-LEAD LQFP

Table 8 through Table 10 identify the pin functions that are multiplexed on the general-purpose I/O pins of the 120-lead LQFP package.

**Table 8. Signal Multiplexing for Port A (120-Lead LQFP)**

| Signal Name | Multiplexed Function 0 | Multiplexed Function 1 | Multiplexed Function 2 | Multiplexed Function 3 | Multiplexed Function Input Tap |
|-------------|------------------------|------------------------|------------------------|------------------------|--------------------------------|
| PA_00       | PWM0_SYNC              |                        | SPT1_ACLK              |                        |                                |
| PA_01       | PWM0_TRIP0             |                        | SPT1_AFS               |                        |                                |
| PA_02       | PWM0_AH                |                        | SPT1_AD0               |                        |                                |
| PA_03       | PWM0_AL                |                        | SPT1_AD1               |                        |                                |
| PA_04       | PWM0_BH                |                        | SPT1_BCLK              |                        |                                |
| PA_05       | PWM0_BL                |                        | SPT1_BFS               |                        |                                |
| PA_06       | PWM0_CH                |                        | SPT1_BD0               |                        |                                |

## ADSP-CM407F/ADSP-CM408F 176-LEAD LQFP SIGNAL DESCRIPTIONS

The processor's pin definitions are shown [Table 11](#). The columns in this table provide the following information:

- **Signal Name:** The Signal Name column in the table includes the signal name for every pin and (where applicable) the GPIO multiplexed pin function for every pin.
- **Description:** The Description column in the table provides a verbose (descriptive) name for the signal.
- **General-Purpose Port:** The Port column in the table shows whether or not the signal is multiplexed with other signals on a general-purpose I/O port pin.
- **Pin Name:** The Pin Name column in the table identifies the name of the package pin (at power on reset) on which the signal is located (if a single function pin) or is multiplexed (if a general-purpose I/O pin).

**Table 11. ADSP-CM407F/ADSP-CM408F 176-Lead LQFP Signal Descriptions**

| Signal Name | Description   | Port      | Pin Name   |
|-------------|---|-----------|------------|
| ADC0_VIN00  | Channel 0 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN00 |
| ADC0_VIN01  | Channel 1 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN01 |
| ADC0_VIN02  | Channel 2 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN02 |
| ADC0_VIN03  | Channel 3 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN03 |
| ADC0_VIN04  | Channel 4 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN04 |
| ADC0_VIN05  | Channel 5 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN05 |
| ADC0_VIN06  | Channel 6 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN06 |
| ADC0_VIN07  | Channel 7 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN07 |
| ADC1_VIN00  | Channel 0 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN00 |
| ADC1_VIN01  | Channel 1 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN01 |
| ADC1_VIN02  | Channel 2 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN02 |
| ADC1_VIN03  | Channel 3 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN03 |
| ADC1_VIN04  | Channel 4 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN04 |
| ADC1_VIN05  | Channel 5 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN05 |
| ADC1_VIN06  | Channel 6 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN06 |
| ADC1_VIN07  | Channel 7 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN07 |
| BYP_A0      | On-chip Analog Power Regulation Bypass Filter Node for ADC0 (see recommended bypass - <a href="#">Figure 4 on Page 6</a> )              | Not Muxed | BYP_A0     |
| BYP_A1      | On-chip Analog Power Regulation Bypass Filter Node for ADC1 (see recommended bypass - <a href="#">Figure 4 on Page 6</a> )              | Not Muxed | BYP_A1     |
| BYP_D0      | On-chip Digital Power Regulation Bypass Filter Node for Analog Subsystem (see recommended bypass - <a href="#">Figure 4 on Page 6</a> ) | Not Muxed | BYP_D0     |
| CAN0_RX     | CAN0 Receive  | B         | PB_15      |
| CAN0_TX     | CAN0 Transmit   | C         | PC_00      |
| CAN1_RX     | CAN1 Receive  | B         | PB_10      |
| CAN1_TX     | CAN1 Transmit   | B         | PB_11      |
| CNT0_DG     | CNT0 Count Down and Gate  | B         | PB_02      |
| CNT0_OUTA   | CNT0 Output Divider A   | B         | PB_13      |
| CNT0_OUTA   | CNT0 Output Divider A   | F         | PF_00      |
| CNT0_OUTB   | CNT0 Output Divider B   | B         | PB_14      |
| CNT0_OUTB   | CNT0 Output Divider B   | F         | PF_01      |
| CNT0_UD     | CNT0 Count Up and Direction   | B         | PB_01      |
| CNT0_ZM     | CNT0 Count Zero Marker  | B         | PB_00      |
| CNT1_DG     | CNT1 Count Down and Gate  | B         | PB_05      |
| CNT1_OUTA   | CNT1 Output Divider A   | E         | PE_14      |
| CNT1_OUTB   | CNT1 Output Divider B   | E         | PE_15      |

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

## ADSP-CM407F/ADSP-CM408F GPIO MULTIPLEXING FOR 176-LEAD LQFP

Table 12 through Table 17 identify the pin functions that are multiplexed on the general-purpose I/O pins of the 176-lead LQFP package.

**Table 12. Signal Multiplexing for Port A (176-Lead LQFP)**

| Signal Name | Multiplexed Function 0 | Multiplexed Function 1 | Multiplexed Function 2 | Multiplexed Function 3 | Multiplexed Function Input Tap |
|-------------|------------------------|------------------------|------------------------|------------------------|--------------------------------|
| PA_00       | PWM0_SYNC              |                        | SPT1_ACLK              |                        |                                |
| PA_01       | PWM0_TRIP0             |                        | SPT1_AFS               |                        |                                |
| PA_02       | PWM0_AH                |                        | SPT1_AD0               |                        |                                |
| PA_03       | PWM0_AL                |                        | SPT1_AD1               |                        |                                |
| PA_04       | PWM0_BH                |                        | SPT1_BCLK              |                        |                                |
| PA_05       | PWM0_BL                |                        | SPT1_BFS               |                        |                                |
| PA_06       | PWM0_CH                |                        | SPT1_BD0               |                        |                                |
| PA_07       | PWM0_CL                | SMC0_AMS2              | SPT1_BD1               |                        |                                |
| PA_08       | PWM1_CH                |                        | SMC0_D00               |                        | TM0_ACLK5                      |
| PA_09       | PWM1_CL                |                        | SMC0_D01               |                        | TM0_ACLK4                      |
| PA_10       | PWM1_SYNC              |                        | SMC0_D02               |                        | TM0_ACLK3                      |
| PA_11       | PWM1_TRIP0             | UART1_CTS              | SMC0_D03               |                        | TM0_ACLK2                      |
| PA_12       | PWM1_AH                | TM0_TMR4               | SMC0_D04               |                        |                                |

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

## ADSP-CM409F 212-BALL BGA SIGNAL DESCRIPTIONS

The processor's pin definitions are shown in [Table 18](#). The columns in this table provide the following information:

- **Signal Name:** The Signal Name column in the table includes the signal name for every pin and (where applicable) the GPIO multiplexed pin function for every pin.
- **Description:** The Description column in the table provides a verbose (descriptive) name for the signal.
- **General-Purpose Port:** The Port column in the table shows whether or not the signal is multiplexed with other signals on a general-purpose I/O port pin.
- **Pin Name:** The Pin Name column in the table identifies the name of the package pin (at power on reset) on which the signal is located (if a single function pin) or is multiplexed (if a general-purpose I/O pin).

**Table 18. ADSP-CM409F 212-Ball BGA Signal Descriptions**

| Signal Name | Description   | Port      | Pin Name   |
|-------------|---|-----------|------------|
| ADC0_VIN00  | Channel 0 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN00 |
| ADC0_VIN01  | Channel 1 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN01 |
| ADC0_VIN02  | Channel 2 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN02 |
| ADC0_VIN03  | Channel 3 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN03 |
| ADC0_VIN04  | Channel 4 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN04 |
| ADC0_VIN05  | Channel 5 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN05 |
| ADC0_VIN06  | Channel 6 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN06 |
| ADC0_VIN07  | Channel 7 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN07 |
| ADC0_VIN08  | Channel 8 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN08 |
| ADC0_VIN09  | Channel 9 Single-Ended Analog Input for ADC0  | Not Muxed | ADC0_VIN09 |
| ADC0_VIN10  | Channel 10 Single-Ended Analog Input for ADC0   | Not Muxed | ADC0_VIN10 |
| ADC0_VIN11  | Channel 11 Single-Ended Analog Input for ADC0   | Not Muxed | ADC0_VIN11 |
| ADC1_VIN00  | Channel 0 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN00 |
| ADC1_VIN01  | Channel 1 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN01 |
| ADC1_VIN02  | Channel 2 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN02 |
| ADC1_VIN03  | Channel 3 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN03 |
| ADC1_VIN04  | Channel 4 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN04 |
| ADC1_VIN05  | Channel 5 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN05 |
| ADC1_VIN06  | Channel 6 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN06 |
| ADC1_VIN07  | Channel 7 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN07 |
| ADC1_VIN08  | Channel 8 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN08 |
| ADC1_VIN09  | Channel 9 Single-Ended Analog Input for ADC1  | Not Muxed | ADC1_VIN09 |
| ADC1_VIN10  | Channel 10 Single-Ended Analog Input for ADC1   | Not Muxed | ADC1_VIN10 |
| ADC1_VIN11  | Channel 11 Single-Ended Analog Input for ADC1   | Not Muxed | ADC1_VIN11 |
| BYP_A0      | On-chip Analog Power Regulation Bypass Filter Node for ADC0 (see recommended bypass - <a href="#">Figure 4 on Page 6</a> )              | Not Muxed | BYP_A0     |

## ADSP-CM409F GPIO MULTIPLEXING FOR 212-BALL BGA

Table 19 through Table 24 identify the pin functions that are multiplexed on the general-purpose I/O pins of the 212-ball BGA package.

Table 19. Signal Multiplexing for Port A (212-Ball BGA)

| Signal Name | Multiplexed Function 0 | Multiplexed Function 1 | Multiplexed Function 2 | Multiplexed Function 3 | Multiplexed Function Input Tap |
|-------------|------------------------|------------------------|------------------------|------------------------|--------------------------------|

## ADSP-CM40xF DESIGNER QUICK REFERENCE

Table 25 provides a quick reference summary of pin related information for circuit board design. The columns in this table provide the following information:

- **Signal Name:** The Signal Name column in the table includes the signal name for every pin and (where applicable) the GPIO multiplexed pin function for every pin.
- **Pin Type:** The Type column in the table identifies the I/O type or supply type of the pin. The abbreviations used in this column are na (none), I/O (input/output), a (analog), s (supply), and g (ground).
- **Driver Type:** The Driver Type column in the table identifies the driver type used by the pin. The driver types are defined in the output drive currents section of this data sheet.
- **Internal Termination:** The Int Term column in the table specifies the termination present when the processor is not in the reset state. The abbreviations used in this column are wk (weak keeper, weakly retains previous value driven on the pin), pu (pull-up), or pd (pull-down).
- **Reset Termination:** The Reset Term column in the table specifies the termination present when the processor is in the reset state. The abbreviations used in this column are wk (weak keeper, weakly retains previous value driven on the pin), pu (pull-up), or pd (pull-down).
- **Reset Drive:** The Reset Drive column in the table specifies the active drive on the signal when the processor is in the reset state.
- **Power Domain:** The Power Domain column in the table specifies the power supply domain in which the signal resides.
- **Description and Notes:** The Description and Notes column in the table identifies any special requirements or characteristics for the signal. If no special requirements are listed the signal may be left unconnected if it is not used. Also, for multiplexed general-purpose I/O pins, this column identifies the functions available on the pin.

**Table 25. ADSP-CM40xF Designer Quick Reference**

| Signal Name | Type | Driver Type | Int Term | Reset Term | Reset Drive | Power Domain | Description and Notes   |

### OPERATING CONDITIONS

| Parameter         | Test Conditions/Comments        | Min   | Nominal                  | Max                      | Unit          |                  |
|-------------------|---------------------------------|---|--------------------------|--------------------------|---------------|------------------|
| $V_{DD\_INT}$     | Digital Internal Supply Voltage | $f_{CLK} \leq 240$ MHz                                    | 1.14                     | 1.2                      | 1.26          | V                |
| $V_{DD\_EXT}^1$   | Digital External Supply Voltage |   | 3.13                     | 3.3                      | 3.47          | V                |
| $V_{DD\_ANA}^1$   | Analog Supply Voltage           |   | 3.13                     | 3.3                      | 3.47          | V                |
| $V_{IH}^2$        | High Level Input Voltage        | $V_{DD\_EXT} = 3.47$ V                                    | 2.0                      |                          |               | V                |
| $V_{IH\_CLKIN}^3$ | High Level Input Voltage        | $V_{DD\_EXT} = 3.47$ V                                    | 2.2                      |                          |               | V                |
| $V_{IHTWI}^{4,5}$ | High Level Input Voltage        | $V_{DD\_EXT} = 3.47$ V                                    | $0.7 \times V_{VBUSTWI}$ |                          | $V_{VBUSTWI}$ | V                |
| $V_{IL}^2$        | Low Level Input Voltage         | $V_{DD\_EXT} = 3.13$ V                                    |                          | 0.8                      |               | V                |
| $V_{ILTWI}^{4,5}$ | Low Level Input Voltage         | $V_{DD\_EXT} = 3.13$ V                                    |                          | $0.3 \times V_{VBUSTWI}$ |               | V                |
| $T_J$             | Junction Temperature            | $T_{AMBIENT} = -40^\circ\text{C}$ to $+105^\circ\text{C}$ | -40                      |                          | +125          | $^\circ\text{C}$ |

<sup>1</sup> Must remain powered (even if the associated function is not used).

<sup>2</sup> Parameter value applies to all input and bidirectional signals except TWI signals and USB0 signals.

<sup>3</sup> Parameter applies to SYS\_CLKIN signal.

<sup>4</sup> Parameter applies to TWI\_SDA and TWI\_SCL.

<sup>5</sup> TWI signals are pulled up to  $V_{VBUSTWI}$ . See Table 26.

Table 26. TWI\_VSEL Selections and  $V_{DD\_EXT}/V_{VBUSTWI}$

| TWI_DT Setting      | $V_{DD\_EXT}$ Nominal | $V_{VBUSTWI}$ Min | $V_{VBUSTWI}$ Nom | $V_{VBUSTWI}$ Max | Unit |
|---------------------|-----------------------|-------------------|-------------------|-------------------|------|
| TWI000 <sup>1</sup> | 3.30                  | 3.13              | 3.30              | 3.47              | V    |
| TWI100              | 3.30                  | 4.75              | 5.00              | 5.25              | V    |

<sup>1</sup> Designs must comply with the  $V_{DD\_EXT}$  and  $V_{VBUSTWI}$  voltages specified for the default TWI\_DT setting for correct JTAG boundary scan operation during reset.

### Clock Related Operating Conditions

Table 27 describes the core clock, system clock, and peripheral clock timing requirements. The data presented in the tables applies to all speed grades found in the Ordering Guide on Page 124 except where expressly noted. Figure 10 provides a graphical representation of the various clocks and their available multiplier or divider values.

Figure 10. Clock Relationships and Divider Values

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

**Table 27. Clock Related Operating Conditions**

| Parameter                   | Restriction  | Min  | Typ | Max | Unit |
|-----------------------------|--|--|-----|-----|------|
| f <sub>PLLCLK</sub>         | PLL Clock Frequency  | 250  |     | 960 | MHz  |
| f <sub>CCLK</sub>           | Core Clock Frequency   | f <sub>CCLK</sub> ≥ f <sub>SCLK</sub>          |     | 240 | MHz  |
| f <sub>SCLK</sub>           | SCLK Frequency <sup>1, 2</sup>   |  |     | 100 | MHz  |
| f <sub>USBCLK</sub>         | USBCLK Frequency <sup>3, 4</sup>   | f <sub>SCLK</sub> ≥ f <sub>USBCLK</sub>        |     | 60  | MHz  |
| f <sub>OCLK</sub>           | Output Clock Frequency   |  |     | 50  | MHz  |
| f <sub>TCK</sub>            | JTG_TCK Frequency  | f <sub>TCK</sub> ≤ f <sub>SCLK</sub> /2        |     | 50  | MHz  |
| f <sub>SYS_CLKOUTJ</sub>    | SYS_CLKOUT Period Jitter <sup>5, 6</sup>                                 |  | ±1  |     | %    |
| f <sub>ADCC_ACLK_PROG</sub> | Programmed ADCC ADC0 (A) Clock   |  |     | 50  | MHz  |
| f <sub>ADCC_BCLK_PROG</sub> | Programmed ADCC ADC1 (B) Clock   |  |     | 50  | MHz  |
| f <sub>DACC_ACLK_PROG</sub> | Programmed DACC DAC0 (A) Clock   |  |     | 50  | MHz  |
| f <sub>DACC_BCLK_PROG</sub> | Programmed DACC DAC1 (B) Clock   |  |     | 50  | MHz  |
| f <sub>SPTCLKPROG</sub>     | Programmed SPT Clock When Transmitting Data and Frame Sync               |  |     | 50  | MHz  |
| f <sub>SPTCLKPROG</sub>     | Programmed SPT Clock When Receiving Data and Frame Sync                  |  |     | 50  | MHz  |
| f <sub>SPTCLKEXT</sub>      | External SPT Clock When Transmitting Data and Frame Sync <sup>7, 8</sup> | f <sub>SPTCLKEXT</sub> ≤ f <sub>SCLK</sub>     |     | 50  | MHz  |
| f <sub>SPTCLKEXT</sub>      | External SPT Clock When Receiving Data and Frame Sync <sup>7, 8</sup>    | f <sub>SPTCLKEXT</sub> ≤ f <sub>SCLK</sub>     |     | 50  | MHz  |
| f <sub>SPICLKPROG</sub>     | Programmed SPI Clock When Transmitting Data <sup>7, 8</sup>              |  |     | 50  | MHz  |
| f <sub>SPICLKPROG</sub>     | Programmed SPI Clock When Receiving Data                                 |  |     | 50  | MHz  |
| f <sub>SPICLKEXT</sub>      | External SPI Clock When Transmitting Data <sup>7, 8</sup>                | f <sub>SPICLKEXT</sub> ≤ f <sub>SCLK</sub>     |     | 50  | MHz  |
| f <sub>SPICLKEXT</sub>      | External SPI Clock When Receiving Data <sup>7, 8</sup>                   | f <sub>SPICLKEXT</sub> ≤ f <sub>SCLK</sub>     |     | 50  | MHz  |
| f <sub>TMRLKEXT</sub>       | External TMR Clock   | f <sub>TMRLKEXT</sub> ≤ f <sub>SCLK</sub> /4   |     | 25  | MHz  |
| f <sub>SINCLKPROG</sub>     | Programmed SINC Clock  | f <sub>SINCLKPROG</sub> ≤ f <sub>SCLK</sub> /4 |     | 20  | MHz  |
| f <sub>REFCLKEXT</sub>      | External Ethernet MAC Clock  | f <sub>REFCLKEXT</sub> ≤ f <sub>SCLK</sub>     |     | 50  | MHz  |

<sup>1</sup> Supporting documents may use either SCLK or SYSCLK when referring to system clock frequency.

<sup>2</sup> SCLK is the clock for the system logic. Documentation may interchangeably refer to this clock as SYSCLK, for example, for PLL configuration MMR accesses.

<sup>3</sup> Supporting documents may use either USBCLK or DCLK when referring to USB clock frequency.

<sup>4</sup> USBCLK is the clock for the USB peripheral. Documentation may interchangeably refer to this clock as DCLK, for example, for PLL configuration MMR accesses.

<sup>5</sup> SYS\_CLKOUT jitter is dependent on the application system design including pin switching activity, board layout, and the jitter characteristics of the SYS\_CLKIN source. Due to the dependency on these factors the measured jitter may be higher or lower than this specification for each end application.

<sup>6</sup> The value in the Typ field is the percentage of the SYS\_CLKOUT period.

<sup>7</sup> The maximum achievable frequency for any peripheral in external clock mode is dependent on being able to meet the setup and hold times in the ac timing specifications for that peripheral.

<sup>8</sup> The peripheral external clock frequency must also be less than or equal to f<sub>SCLK</sub> that clocks the peripheral.

## Total Power Dissipation (PD)

Total power dissipation is the sum of power dissipation for each  $V_{DD}$  domain, shown in the following equation.

$$P_D = P_{D\_INT} + P_{D\_ANA} + P_{D\_EXT}$$

where:

$$P_{D\_INT} = V_{DD\_INT} \times I_{DD\_INT} - \text{Internal voltage domain power dissipation}$$

$$P_{D\_ANA} = V_{DD\_ANA} \times I_{DD\_ANA} - \text{Analog 3.3 V voltage domain power dissipation}$$

$$P_{D\_EXT} = V_{DD\_EXT} \times I_{DD\_EXT} - \text{Digital 3.3 V voltage domain power dissipation}$$

## Total External Power Dissipation (IDD\_EXT)

There are three different items that contribute to the digital 3.3 V supply power dissipation: I/O switching, flash subsystem, and analog subsystem (digital portion), shown in the following equation.

$$I_{DDEXT\_TOT} = I_{DDEXT\_IO} + I_{DDEXT\_FLASH} + I_{DDEXT\_ANA}$$

where:

$$I_{DDEXT\_IO/ANA} \text{ (mA)} = \Sigma \{ V_{DD\_EXT} \times C_L f / 2 \times (O \times TR) \times U \} - \text{I/O switching current}$$

The I/O switching current is the sum of the switching current for all of the enabled peripherals. For each peripheral the capacitive load of each pin in Farads ( $C_L$ ), operating frequency in MHz ( $f$ ), number of output pins ( $O$ ), toggle ratio for each pin ( $TR$ ), and peripheral utilization ( $U$ ) are considered.

$$I_{DDEXT\_FLASH} \text{ (mA)} = 25 \text{ mA} - \text{maximum flash subsystem current}$$

## Total Processor Internal Power Dissipation (IDD\_INT)

Many operating conditions affect power dissipation, including temperature, voltage, operating frequency, and processor activity. Total internal power dissipation for the processor subsystem has two components:

1. Static, including leakage current
2. Dynamic, due to transistors switching characteristics for each clock domain. Application-dependent currents, clock currents, and data transmission currents all contribute to dynamic power dissipation.

The following equation describes the internal current consumption.

$$I_{DDINT\_TOT} = I_{DDINT\_CCLK\_DYN} + I_{DDINT\_SCLK\_DYN} + I_{DDINT\_DMA\_DR\_DYN} + I_{DDINT\_STATIC}$$

## Static Current

$I_{DDINT\_STATIC}$  is the current present in the device with all clocks stopped.  $I_{DDINT\_STATIC}$  is specified as a function of temperature (see Figure 11).

Figure 11. Static Current— $I_{DDINT\_STATIC}$  (mA)

## Core Clock Application-Dependent Current

Core clock (CCLK) use is subject to an activity scaling factor (ASF) that represents application code running on the processor core and L1 memory (Table 28). The ASF is combined with the CCLK frequency to calculate this portion.

$$I_{DDINT\_CCLK\_DYN} \text{ (mA)} = 0.192 \times f_{CCLK} \text{ (MHz)} \times ASF \times V_{DD\_INT} \text{ (V)}$$

Table 28. Activity Scaling Factors (ASF)

| $I_{DD\_INT}$ Power Vector   | ASF  |
|------------------------------|------|
| $I_{DD\_PEAK}$               | 1.85 |
| $I_{DD\_COREMARK}$ (typical) | 1.0  |
| $I_{DD\_IDLE}$               | 0.31 |

## System Clock Current

The power dissipated by the system clock domain is dependent on operating frequency and a unique scaling factor.

$$I_{DDINT\_SCLK\_DYN} \text{ (mA)} = 0.308 \times f_{SCLK} \text{ (MHz)} \times V_{DD\_INT} \text{ (V)}$$

## Data Transmission Current

The data transmission current represents the power dissipated when transmitting data. This current is expressed in terms of data rate. The calculation is performed by adding the data rate (MB/s) of each DMA and core driven access to peripherals and L2/external memory. This number is then multiplied by a coefficient. The following equation provides an estimate of all data transmission current.

$$I_{DDINT\_DMA\_DR\_DYN} \text{ (mA)} = 0.0475 \times \text{data rate (MB/s)} \times V_{DD\_INT} \text{ (V)}$$

## FLASH SPECIFICATIONS

The Flash features include:

- 100,000 ERASE cycles per sector
- 20 years data retention

### Flash PROGRAM/ERASE SUSPEND Command

Table 29 lists parameters for the Flash suspend command.

Table 29. Suspend Parameters

| Parameter                               | Condition  | Typ | Max | Unit |
|---|--|-----|-----|------|
| Erase to Suspend <sup>1</sup>           | Sector erase or erase resume to erase suspend              | 700 | –   | μs   |
| Program to Suspend <sup>1</sup>         | Program resume to program suspend                          | 5   | –   | μs   |
| Subsector Erase to Suspend <sup>1</sup> | Subsector erase or subsector erase resume to erase suspend | 50  | –   | μs   |
| Suspend Latency <sup>2</sup>            | Program  | 7   | –   | μs   |
| Suspend Latency <sup>2</sup>            | Subsector erase  | 15  | –   | μs   |
| Suspend Latency <sup>3</sup>            | Erase  | 15  | –   | μs   |

<sup>1</sup>Timing is not internally controlled.

<sup>2</sup>Any read command accepted.

<sup>3</sup>Any command except the following are accepted: sector, subsector, or bulk erase; write status register.

### Flash AC Characteristics and Operating Conditions

Table 30 identifies Flash specific operating conditions.

Table 30. AC Characteristics and Operating Conditions

| Parameter   | Symbol           | Min | Typ <sup>1</sup> | Max | Unit |
|---|------------------|-----|------------------|-----|------|
| Clock Frequency for All Commands other than Read (SPI-ER, QIO-SPI Protocol), T <sub>J</sub> = 105°C | f <sub>C</sub>   | DC  | –                | 100 | MHz  |
| Clock Frequency for All Commands other than Read (SPI-ER, QIO-SPI Protocol), T <sub>J</sub> = 125°C | f <sub>C</sub>   | DC  | –                | 97  | MHz  |
| Clock Frequency for Read Commands, T <sub>J</sub> = 105°C   | f <sub>R</sub>   | DC  | –                | 50  | MHz  |
| Clock Frequency for Read Commands, T <sub>J</sub> = 125°C   | f <sub>R</sub>   | DC  | –                | 45  | MHz  |
| Page Program Cycle Time (256 bytes) <sup>2</sup>  | t <sub>PP</sub>  | –   | 0.5              | 5   | ms   |
| Page Program Cycle Time (n bytes) <sup>2,3</sup>  | t <sub>PP</sub>  | –   | int(n/8) × 0.015 | 5   | ms   |
| Subsector Erase Cycle Time  | t <sub>SSE</sub> | –   | 0.3              | 1.5 | sec  |
| Sector Erase Cycle Time   | t <sub>SE</sub>  | –   | 0.7              | 3   | sec  |
| Bulk Erase Cycle Time   | t <sub>BE</sub>  | –   | 170              | 250 | sec  |

<sup>1</sup>Typical values given for T<sub>J</sub> = 25°C.

<sup>2</sup>When using the page program command to program consecutive bytes, optimized timings are obtained with one sequence including all the bytes vs. several sequences of only a few bytes (1 < n < 256).

<sup>3</sup>int(A) corresponds to the upper integer part of A. For example int(12/8) = 2, int(32/8) = 4 int(15.3) = 16.

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

## ABSOLUTE MAXIMUM RATINGS

Stresses at or above those listed in [Table 31](#) may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

**Table 31. Absolute Maximum Ratings**

| Parameter  | Rating                           |
|--|----------------------------------|
| Internal Supply Voltage ( $V_{DD\_INT}$ )                                | -0.33 V to +1.32 V               |
| External (I/O) Supply Voltage ( $V_{DD\_EXT}$ )                          | -0.33 V to +3.63 V               |
| Analog Supply Voltage ( $V_{DD\_ANA}$ )                                  | -0.33 V to +3.63 V               |
| Digital Input Voltage <sup>1,2</sup>                                     | -0.33 V to +3.63 V               |
| TWI Digital Input Voltage <sup>1,2,3</sup>                               | -0.33 V to +5.50 V               |
| Digital Output Voltage Swing   | -0.33 V to $V_{DD\_EXT} + 0.5$ V |
| Analog Input Voltage <sup>4</sup>  | -0.33 V to +3.63 V               |
| Voltage Reference Input Voltage ( $V_{REF0}$ , $V_{REF1}$ ) <sup>4</sup> | -0.33 V to +2.75 V               |
| USB0_Dx Input  | -0.33 V to +5.25 V               |
| USB0_VBUS Input Voltage  | -0.33 V to +6.00 V               |
| $I_{OH}/I_{OL}$ Current per Signal <sup>1</sup>                          | 6 mA (max)                       |
| Storage Temperature Range  | -65°C to +150°C                  |
| Junction Temperature While Biased  | +125°C                           |

<sup>1</sup> Applies to 100% transient duty cycle. For other duty cycles, see [Table 32](#).

<sup>2</sup> Applies only when  $V_{DD\_EXT}$  is within specifications. When  $V_{DD\_EXT}$  is outside specifications, the range is  $V_{DD\_EXT} \pm 0.2$  V.

<sup>3</sup> Applies to pins TWI\_SCL and TWI\_SDA.

<sup>4</sup> Applies only when  $V_{DD\_ANA}$  is within specification. When  $V_{DD\_ANA}$  is outside specifications, the range is  $V_{DD\_ANA} \pm 0.2$  V.

**Table 32. Maximum Duty Cycle for Input Transient Voltage<sup>1</sup>**

| Maximum Duty Cycle (%) <sup>2</sup> | $V_{IN}$ Min (V) <sup>3</sup> | $V_{IN}$ Max (V) <sup>3</sup> |
|-------------------------------------|-------------------------------|-------------------------------|
| 100                                 | -0.33                         | +3.63                         |
| 50                                  | -0.46                         | +3.78                         |
| 40                                  | -0.52                         | +3.85                         |
| 25                                  | -0.63                         | +3.96                         |
| 20                                  | -0.67                         | +3.99                         |
| 15                                  | -0.70                         | +4.03                         |
| 10                                  | -0.73                         | +4.07                         |

<sup>1</sup> Applies to all signal pins with the exception of SYS\_CLKIN, SYS\_XTAL, USB0\_DP, USB0\_DM, USB0\_VBUS, and TWI signals.

<sup>2</sup> Applies only when  $V_{DD\_EXT}$  is within specifications. When  $V_{DD\_EXT}$  is outside specifications, the range is  $V_{DD\_EXT} \pm 0.2$  V.

<sup>3</sup> The individual values cannot be combined for analysis of a single instance of overshoot or undershoot. The worst case observed value must fall within one of the specified voltages, and the total duration of the overshoot or undershoot (exceeding the 100% case) must be less than or equal to the corresponding duty cycle.

## ESD SENSITIVITY

### ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PACKAGE INFORMATION

The information presented in [Figure 23](#) and [Table 33](#) provides details about package branding. For a complete listing of product availability, see [Ordering Guide on Page 124](#).

*Figure 23. Product Information on Package<sup>1</sup>*

<sup>1</sup> Exact brand may differ, depending on package type.

**Table 33. Package Brand Information**

| Brand Key   | Field Description                  |
|-------------|------------------------------------|
| ADSP-CM40xF | Product model                      |
| t           | Temperature range                  |
| pp          | Package type                       |
| Z           | RoHS compliant designation         |
| cc          | See <a href="#">Ordering Guide</a> |
| vvvvvv.x    | Assembly lot code                  |

## TIMING SPECIFICATIONS

Specifications are subject to change without notice.

### Clock and Reset Timing

Table 34 and Figure 24 describe clock and reset operations related to the clock generation unit (CGU) and reset control unit (RCU). Per the CCLK, SCLK, USBCLK, and OCLK timing specifications in Table 27 Clock Related Operating Conditions, combinations of SYS\_CLKIN and clock multipliers must not select clock rates in excess of the processor's maximum instruction rate.

Table 34. Clock and Reset Timing

| Parameter                  |   | Min                  | Max | Unit |
|----------------------------|---|----------------------|-----|------|
| <i>Timing Requirements</i> |   |                      |     |      |
| $f_{CKIN}$                 | SYS_CLKIN Frequency (Using a Crystal) <sup>1, 2, 3</sup>            | 20                   | 50  | MHz  |
| $f_{CKIN}$                 | SYS_CLKIN Frequency (Using a Crystal Oscillator) <sup>1, 2, 3</sup> | 20                   | 60  | MHz  |
| $t_{CKINL}$                | SYS_CLKIN Low Pulse <sup>1</sup>                                    | 6.67                 |     | ns   |
| $t_{CKINH}$                | SYS_CLKIN High Pulse <sup>1</sup>                                   | 6.67                 |     | ns   |
| $t_{WRST}$                 | $\overline{SYS\_HWRST}$ Asserted Pulse Width Low <sup>4</sup>       | $11 \times t_{CKIN}$ |     | ns   |

<sup>1</sup> Applies to PLL bypass mode and PLL nonbypass mode.

<sup>2</sup> The  $t_{CKIN}$  period (see Figure 24) equals  $1/f_{CKIN}$ .

<sup>3</sup> If the CGU\_CTL.DF bit is set, the minimum  $f_{CKIN}$  specification is 40 MHz.

<sup>4</sup> Applies after power-up sequence is complete. See Table 35 and Figure 25 for power-up reset timing.

Figure 24. Clock and Reset Timing

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

## Power-Up Reset Timing

Table 35 and Figure 25 show the relationship between power supply startup and processor reset timing, related to the clock generation unit (CGU) and reset control unit (RCU). In Figure 25,  $V_{DD\_SUPPLIES}$  are  $V_{DD\_INT}$ ,  $V_{DD\_EXT}$ ,  $V_{DD\_VREG}$ ,  $V_{DD\_ANA0}$ , and  $V_{DD\_ANA1}$ .

Table 35. Power-Up Reset Timing

| Parameter  | Min                  | Max | Unit |
|--|----------------------|-----|------|
| <i>Timing Requirement</i>  |                      |     |      |
| $t_{RST\_IN\_PWR}$ $\overline{SYS\_HWRST}$ and $\overline{JTG\_TRST}$ Deasserted after $V_{DD\_INT}$ , $V_{DD\_EXT}$ , $V_{DD\_VREG}$ , $V_{DD\_ANA0}$ , $V_{DD\_ANA1}$ , and $SYS\_CLKIN$ are Stable and Within Specification | $11 \times t_{CKIN}$ |     | ns   |

Figure 25. Power-Up Reset Timing

## Serial Ports

To determine whether serial port (SPORT) communication is possible between two devices at clock speed  $n$ , the following specifications must be confirmed: 1) frame sync delay and frame sync setup and hold, 2) data delay and data setup and hold, and 3) serial clock (SPT\_CLK) width. In [Figure 31](#) either the rising edge or the falling edge of SPT\_CLK (external or internal) can be used as the active sampling edge.

When externally generated the SPORT clock is called  $f_{SPTCLKEXT}$ :

$$t_{SPTCLKEXT} = \frac{1}{f_{SPTCLKEXT}}$$

When internally generated, the programmed SPORT clock ( $f_{SPTCLKPROG}$ ) frequency in MHz is set by the following equation where CLKDIV is a field in the SPORT\_DIV register that can be set from 0 to 65,535:

$$f_{SPTCLKPROG} = \frac{f_{SCLK}}{(CLKDIV + 1)}$$

$$t_{SPTCLKPROG} = \frac{1}{f_{SPTCLKPROG}}$$

**Table 42. Serial Ports—External Clock**

## Serial Peripheral Interface (SPI) Port—Master Timing

Table 47 and Figure 35 describe serial peripheral interface (SPI) port master operations. When internally generated, the programmed SPI clock ( $f_{SPICLKPROG}$ ) frequency in MHz is set by the following equation where BAUD is a field in the SPI\_CLK register that can be set from 0 to 65,535:

$$f_{SPICLKPROG} = \frac{f_{SCLK}}{(BAUD + 1)}$$

$$t_{SPICLKPROG} = \frac{1}{f_{SPICLKPROG}}$$

Note that:

- In dual mode data transmit, the SPI\_MISO signal is also an output.
- In quad mode data transmit, the SPI\_MISO, SPI\_D2, and SPI\_D3 signals are also outputs.
- In dual mode data receive, the SPI\_MOSI signal is also an input.
- In quad mode data receive, the SPI\_MOSI, SPI\_D2, and SPI\_D3 signals are also inputs.

**Table 47. Serial Peripheral Interface (SPI) Port—Master Timing**

| Parameter                        |   | Min                                   | Max | Unit |

## Serial Peripheral Interface (SPI) Port—Slave Timing

Table 48 and Figure 36 describe serial peripheral interface (SPI) port slave operations. Note that:

- In dual mode data transmit, the SPI\_MOSI signal is also an output.
- In quad mode data transmit, the SPI\_MOSI, SPI\_D2, and SPI\_D3 signals are also outputs.
- In dual mode data receive, the SPI\_MISO signal is also an input.
- In quad mode data receive, the SPI\_MISO, SPI\_D2, and SPI\_D3 signals are also inputs.
- In SPI slave mode, the SPI clock is supplied externally and is called  $f_{SPICLKEXT}$ :

$$t_{SPICLKEXT} = \frac{1}{f_{SPICLKEXT}}$$

**Table 48. Serial Peripheral Interface (SPI) Port—Slave Timing**

| Parameter   | Min                            | Max  | Unit |
|---|--------------------------------|------|------|
| <i>Timing Requirements</i>  |                                |      |      |
| $t_{SPICHS}$ SPI_CLK High Period <sup>1</sup>                       | $0.5 \times t_{SPICLKEXT} - 1$ |      | ns   |
| $t_{SPICLS}$ SPI_CLK Low Period <sup>1</sup>                        | $0.5 \times t_{SPICLKEXT} - 1$ |      | ns   |
| $t_{SPICLK}$ SPI_CLK Period <sup>1</sup>                            | $t_{SPICLKEXT} - 1$            |      | ns   |
| $t_{HDS}$ Last SPI_CLK Edge to $\overline{SPI\_SS}$ Not Asserted    | 5                              |      | ns   |
| $t_{SPITDS}$ Sequential Transfer Delay                              | $t_{SPICLK} - 1$               |      | ns   |
| $t_{SDSCI}$ $\overline{SPI\_SS}$ Assertion to First SPI_CLK Edge    | 10.5                           |      | ns   |
| $t_{SSPID}$ Data Input Valid to SPI_CLK Edge (Data Input Setup)     | 2                              |      | ns   |
| $t_{HSPID}$ SPI_CLK Sampling Edge to Data Input Invalid             | 1.6                            |      | ns   |
| <i>Switching Characteristics</i>                                    |                                |      |      |
| $t_{DSOE}$ $\overline{SPI\_SS}$ Assertion to Data Out Active        | 0                              | 14   | ns   |
| $t_{DSDHI}$ $\overline{SPI\_SS}$ Deassertion to Data High Impedance | 0                              | 12.5 | ns   |
| $t_{DDSPID}$ SPI_CLK Edge to Data Out Valid (Data Out Delay)        |                                | 14   | ns   |
| $t_{HDSPID}$ SPI_CLK Edge to Data Out Invalid (Data Out Hold)       | 0                              |      | ns   |

<sup>1</sup>This specification indicates the minimum instantaneous width or period that can be tolerated due to duty cycle variation or jitter on the external SPI\_CLK. For the external SPI\_CLK maximum frequency see the  $t_{SPICLKEXT}$  specification in [Table 27 Clock Related Operating Conditions](#).

## Serial Peripheral Interface (SPI) Port—SPI\_RDY Master Timing

SPI\_RDY is used to provide flow control. The CPOL and CPHA bits are set in SPI\_CTL, while LEADX, LAGX, and STOP are in SPI\_DLY.

Table 52. SPI Port—SPI\_RDY Master Timing

| Parameter   | Min   | Max   | Unit |
|---|---|---|------|
| <i>Timing Requirements</i>  |   |   |      |
| $t_{SRDYSCKM0}$ Minimum Setup Time for SPI_RDY De-assertion in Master Mode Before Last Valid SPI_CLK Edge of Valid Data Transfer to Block Subsequent Transfer with CPHA = 0 | $(2 + 2 \times \text{BAUD}^1) \times t_{SCLK} + 10$ |   | ns   |
| $t_{SRDYSCKM1}$ Minimum Setup Time for SPI_RDY De-assertion in Master Mode Before Last Valid SPI_CLK Edge of Valid Data Transfer to Block Subsequent Transfer with CPHA = 1 | $(2 + 2 \times \text{BAUD}^1) \times t_{SCLK} + 10$ |   | ns   |
| <i>Switching Characteristics</i>  |   |   |      |
| $t_{SRDYSCKM}$ Time Between Assertion of SPI_RDY by Slave and First Edge of SPI_CLK for New SPI Transfer with CPHA/CPOL = 0 and BAUD = 0 (STOP, LEAD, LAG = 0)              | $4.5 \times t_{SCLK}$                               | $5.5 \times t_{SCLK} + 10$                            | ns   |
| Time Between Assertion of SPI_RDY by Slave and First Edge of SPI_CLK for New SPI Transfer with CPHA/CPOL = 1 and BAUD = 0 (STOP, LEAD, LAG = 0)                             | $4 \times t_{SCLK}$                                 | $5 \times t_{SCLK} + 10$                              | ns   |
| Time Between Assertion of SPI_RDY by Slave and First Edge of SPI_CLK for New SPI Transfer with CPHA/CPOL = 0 and BAUD $\geq 1$ (STOP, LEAD, LAG = 0)                        | $(1 + 1.5 \times \text{BAUD}^1) \times t_{SCLK}$    | $(2 + 2.5 \times \text{BAUD}^1) \times t_{SCLK} + 10$ | ns   |
| Time Between Assertion of SPI_RDY by Slave and First Edge of SPI_CLK for New SPI Transfer with CPHA/CPOL = 1 and BAUD $\geq 1$ (STOP, LEAD, LAG = 0)                        | $(1 + 1 \times \text{BAUD}^1) \times t_{SCLK}$      | $(2 + 2 \times \text{BAUD}^1) \times t_{SCLK} + 10$   | ns   |

<sup>1</sup> BAUD value set using the SPI\_CLK.BAUD bits. BAUD value = SPI\_CLK.BAUD bits + 1.

## General-Purpose I/O Port Timing

Table 54 and Figure 46 describe I/O timing, related to the general-purpose ports (PORT).

**Table 54. General-Purpose I/O Port Timing**

| Parameter  | Min                 | Max | Unit |
|--|---------------------|-----|------|
| <i>Timing Requirement</i>                                |                     |     |      |
| $t_{WFI}$ General-Purpose I/O Port Pin Input Pulse Width | $2 \times t_{SCLK}$ |     | ns   |

Figure 46. General-Purpose Port Timing

## GPIO Timer Cycle Timing

Table 55, Table 56, and Figure 47 describe timer expired operations, related to the general-purpose timer (TIMER). The input signal is asynchronous in width capture mode and external clock mode and has an absolute maximum input frequency of ( $f_{SCLK}/4$ ) MHz. The width value is the timer period assigned in the  $TMx\_TMRn\_WIDTH$  register and can range from 1 to  $2^{32} - 1$ . Note that when externally generated, the TMR clock is called  $f_{TMRCLKEXT}$ :

$$t_{TMRCLKEXT} = \frac{1}{f_{TMRCLKEXT}}$$

**Table 55. Timer Cycle Timing (Internal Mode)**

| Parameter  | Min                           | Max                           | Unit |
|--|-------------------------------|-------------------------------|------|
| <i>Timing Requirements</i>   |                               |                               |      |
| $t_{WL}$ Timer Pulse Width Input Low (Measured In SCLK Cycles) <sup>1</sup>  | $2 \times t_{SCLK}$           |                               | ns   |
| $t_{WH}$ Timer Pulse Width Input High (Measured In SCLK Cycles) <sup>1</sup> | $2 \times t_{SCLK}$           |                               | ns   |
| <i>Switching Characteristic</i>  |                               |                               |      |
| $t_{HTO}$ Timer Pulse Width Output (Measured In SCLK Cycles) <sup>2</sup>    | $t_{SCLK} \times WIDTH - 1.5$ | $t_{SCLK} \times WIDTH + 1.5$ | ns   |

<sup>1</sup> The minimum pulse width applies for TMx signals in width capture and external clock modes.

<sup>2</sup> WIDTH refers to the value in the  $TMRx\_WIDTH$  register (it can vary from 1 to  $2^{32} - 1$ ).

**Table 56. Timer Cycle Timing (External Mode)**

| Parameter   | Min                               | Max                               | Unit |
|---|-----------------------------------|-----------------------------------|------|
| <i>Timing Requirements</i>  |                                   |                                   |      |
| $t_{WL}$ Timer Pulse Width Input Low (Measured In EXT_CLK Cycles) <sup>1</sup>  | $2 \times t_{EXT\_CLK}$           |                                   | ns   |
| $t_{WH}$ Timer Pulse Width Input High (Measured In EXT_CLK Cycles) <sup>1</sup> | $2 \times t_{EXT\_CLK}$           |                                   | ns   |
| $t_{EXT\_CLK}$ Timer External Clock Period <sup>2</sup>                         | $t_{TMRCLKEXT}$                   |                                   | ns   |
| <i>Switching Characteristic</i>   |                                   |                                   |      |
| $t_{HTO}$ Timer Pulse Width Output (Measured In EXT_CLK Cycles) <sup>3</sup>    | $t_{EXT\_CLK} \times WIDTH - 1.5$ | $t_{EXT\_CLK} \times WIDTH + 1.5$ | ns   |

<sup>1</sup> The minimum pulse width applies for TMx signals in width capture and external clock modes.

<sup>2</sup> This specification indicates the minimum instantaneous width or period that can be tolerated due to duty cycle variation or jitter on the external TMR\_CLK. For the external TMR\_CLK maximum frequency see the  $f_{TMRCLKEXT}$  specification in Table 27 Clock Related Operating Conditions.

<sup>3</sup> WIDTH refers to the value in the  $TMRx\_WIDTH$  register (it can vary from 1 to  $2^{32} - 1$ ).

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

Figure 47. Timer Cycle Timing

## Up/Down Counter/Rotary Encoder Timing

Table 57 and Figure 48 describe timing, related to the general-purpose counter (CNT).

Table 57. Up/Down Counter/Rotary Encoder Timing

| Parameter   | Min                 | Max | Unit |
|---|---------------------|-----|------|
| <i>Timing Requirement</i>                                     |                     |     |      |
| $t_{WCOUNT}$ Up/Down Counter/Rotary Encoder Input Pulse Width | $2 \times t_{SCLK}$ |     | ns   |

Figure 48. Up/Down Counter/Rotary Encoder Timing

## Pulse Width Modulator (PWM) Timing

Table 58 and Figure 49 describe timing, related to the pulse width modulator (PWM).

Table 58. PWM Timing

| Parameter   | Min                       | Max                      | Unit |
|---|---------------------------|--------------------------|------|
| <i>Timing Requirement</i>                                       |                           |                          |      |
| $t_{ES}$ External Sync Pulse Width                              | $2 \times t_{SCLK}$       |                          | ns   |
| <i>Switching Characteristics</i>                                |                           |                          |      |
| $t_{DODIS}$ Output Inactive (Off) After Trip Input <sup>1</sup> |                           | 15                       | ns   |
| $t_{DOE}$ Output Delay After External Sync <sup>1,2</sup>       | $2 \times t_{SCLK} + 5.5$ | $5 \times t_{SCLK} + 14$ | ns   |

<sup>1</sup> PWM outputs are: PWMx\_AH, PWMx\_AL, PWMx\_BH, PWMx\_BL, PWMx\_CH, PWMx\_DH, PWMx\_DL, and PWMx\_CL.

<sup>2</sup> When the external sync signal is synchronous to the peripheral clock, it takes fewer clock cycles for the output to appear compared to when the external sync signal is asynchronous to the peripheral clock. For more information, see the *ADSP-CM40x Microcontroller Hardware Reference*.

Figure 49. PWM Timing

## Pulse Width Modulator (PWM)—Heightened-Precision Mode Timing

Table 59, Table 60, Figure 50, and Figure 51 describe heightened-precision pulse width modulator (PWM) operations.

Table 59. PWM—Heightened-Precision Mode, Output Pulse

| Parameter   | Min   | Max   | Unit |
|---|---|---|------|
| <i>Switching Characteristic</i>                       |   |   |      |
| $t_{HPWMW}$ HP-PWM Output Pulse Width <sup>1, 2</sup> | $(N + m \times 0.25) \times t_{SCLK} - 0.5$ | $(N + m \times 0.25) \times t_{SCLK} + 0.5$ | ns   |

<sup>1</sup> N is the DUTY bit field (coarse duty) from the duty register. m is the ENHDIV (enhanced precision divider bits) value from the HP duty register.

<sup>2</sup> Applies to individual PWM channel with 50% duty cycle. Other PWM channels within the same unit are toggling at the same time. No other GPIO pins are toggling.

Figure 50. PWM Heightened-Precision Mode Timing, Output Pulse

Table 60. PWM—Heightened-Precision Mode, Output Skew

| Parameter                                   | Min | Max | Unit |
|---|-----|-----|------|
| <i>Switching Characteristic</i>             |     |     |      |
| $t_{HPWMS}$ HP-PWM Output Skew <sup>1</sup> |     | 1.0 | ns   |

<sup>1</sup> Output edge difference between any two PWM channels (AH, AL, BH, BL, CH, CL, DH, and DL) in the same PWM unit (a unit is PWMx where x = 0, 1, 2), with the same heightened-precision edge placement.

## 10/100 Ethernet MAC Controller (EMAC) Timing

Table 61 through Table 63 and Figure 52 through Figure 54 describe the 10/100 Ethernet MAC controller operations. Note the externally generated Ethernet MAC clock is called  $f_{REFCLKEXT}$ :

$$t_{REFCLKEXT} = \frac{1}{f_{REFCLKEXT}}$$

Table 61. 10/100 Ethernet MAC Controller (EMAC) Timing: RMI Receive Signal

| Parameter <sup>1</sup>     |  | Min                         | Max                         | Unit |
|----------------------------|--|-----------------------------|-----------------------------|------|
| <i>Timing Requirements</i> |  |                             |                             |      |
| $t_{REFCLK}$               | ETHx_REFCLK Period <sup>2</sup>                                | $t_{REFCLKEXT} - 1\%$       |                             | ns   |
| $t_{REFCLKW}$              | ETHx_REFCLK Width <sup>2</sup>                                 | $t_{REFCLKEXT} \times 35\%$ | $t_{REFCLKEXT} \times 65\%$ | ns   |
| $t_{REFCLKIS}$             | Rx Input Valid to RMI ETHx_REFCLK Rising Edge (Data In Setup)  | 4                           |                             | ns   |
| $t_{REFCLKIH}$             | RMI ETHx_REFCLK Rising Edge to Rx Input Invalid (Data In Hold) | 2.0                         |                             | ns   |

<sup>1</sup> RMI inputs synchronous to RMI REF\_CLK are ERxDx, RMI CRS\_DV, and ERxER.

<sup>2</sup> This specification indicates the minimum instantaneous width or period that can be tolerated due to duty cycle variation or jitter on the external REF\_CLK. For the external REF\_CLK maximum frequency see the  $t_{REFCLKEXT}$  specification in Table 27 Clock Related Operating Conditions.

Figure 52. 10/100 Ethernet MAC Controller Timing: RMI Receive Signal

Table 62. 10/100 Ethernet MAC Controller (EMAC) Timing: RMI Transmit Signal

| Parameter <sup>1</sup>           |  | Min | Max | Unit |
|----------------------------------|--|-----|-----|------|
| <i>Switching Characteristics</i> |  |     |     |      |
| $t_{REFCLKOV}$                   | RMI ETHx_REFCLK Rising Edge to Transmit Output Valid (Data Out Valid)  |     | 14  | ns   |
| $t_{REFCLKOH}$                   | RMI ETHx_REFCLK Rising Edge to Transmit Output Invalid (Data Out Hold) | 2   |     | ns   |

<sup>1</sup> RMI outputs synchronous to RMI REF\_CLK are ETxDx.

## Sinus Cardinalis (SINC) Filter Timing

The programmed sinus cardinalis (SINC) filter clock ( $f_{\text{SINCLKPROG}}$ ) frequency in MHz is set by the following equation where MDIV is a field in the CLK control register that can be set from 4 to 63:

$$f_{\text{SINCLKPROG}} = \frac{f_{\text{SCLK}}}{\text{MDIV}}$$

$$t_{\text{SINCLKPROG}} = \frac{1}{f_{\text{SINCLKPROG}}}$$

**Table 64. SINC Filter Timing**

| Parameter                        |                                       | Min | Max                                      | Unit |
|----------------------------------|---------------------------------------|-----|--|------|
| <i>Timing Requirements</i>       |                                       |     |  |      |
| $t_{\text{SSINC}}$               | SINC0_Dx Setup Before SINC0_CLKx Rise | 9   |  | ns   |
| $t_{\text{HSINC}}$               | SINC0_Dx Hold After SINC0_CLKx Rise   | 0   |  | ns   |
| <i>Switching Characteristics</i> |                                       |     |  |      |
| $t_{\text{SINCLK}}$              | SINC0_CLKx Period <sup>1</sup>        |     | $t_{\text{SINCLKPROG}} - 2.5$            | ns   |
| $t_{\text{SINCLKW}}$             | SINC0_CLKx Width <sup>1</sup>         |     | $0.5 \times t_{\text{SINCLKPROG}} - 2.5$ | ns   |

<sup>1</sup> See [Table 27 Clock Related Operating Conditions](#) for details on the minimum period that may be programmed for  $t_{\text{SINCLKPROG}}$ .

## PROCESSOR TEST CONDITIONS

All timing parameters appearing in this data sheet were measured under the conditions described in this section. Figure 59 shows the measurement point for ac measurements (except output enable/disable). The measurement point  $V_{MEAS}$  is  $V_{DD\_EXT}/2$  for  $V_{DD\_EXT}$  (nominal) = 3.3 V.

Figure 59. Voltage Reference Levels for AC Measurements (Except Output Enable/Disable)

## Output Enable Time Measurement

Output pins are considered to be enabled when they have made a transition from a high impedance state to the point when they start driving.

The output enable time,  $t_{ENA}$ , is the interval from the point when a reference signal reaches a high or low voltage level to the point when the output starts driving as shown on the right side of Figure 60. If multiple pins are enabled, the measurement value is that of the first pin to start driving.

Figure 60. Output Enable/Disable

## Output Disable Time Measurement

Output pins are considered to be disabled when they stop driving, go into a high impedance state, and start to decay from their output high or low voltage. The output disable time,  $t_{DIS}$ , is the interval from when a reference signal reaches a high or low voltage level to the point when the output stops driving as shown on the left side of Figure 60.

## OUTPUT DRIVE CURRENTS

Figure 61 and Figure 62 show typical current-voltage characteristics for the output drivers of the processors. The curves represent the current drive capability of the output drivers as a function of output voltage.

Figure 61. Driver Type A Current

Figure 62. Driver Type B Current

## Capacitive Loading

Output delay, hold, enable, and disable times are based on standard capacitive loads of an average of 6 pF on all pins (see Figure 63).  $V_{LOAD}$  is equal to  $(V_{DD\_EXT})/2$ .

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

**NOTES:**  
THE WORST CASE TRANSMISSION LINE DELAY IS SHOWN AND CAN BE USED FOR THE OUTPUT TIMING ANALYSIS TO REFLECT THE TRANSMISSION LINE EFFECT AND MUST BE CONSIDERED. THE TRANSMISSION LINE (TD), IS FOR LOAD ONLY AND DOES NOT AFFECT THE DATA SHEET TIMING SPECIFICATIONS.

ANALOG DEVICES RECOMMENDS USING THE IBIS MODEL TIMING FOR A GIVEN SYSTEM REQUIREMENT. IF NECESSARY, A SYSTEM MAY INCORPORATE EXTERNAL DRIVERS TO COMPENSATE FOR ANY TIMING DIFFERENCES.

Figure 63. Equivalent Device Loading for AC Measurements (Includes All Fixtures)

The graph of Figure 64 shows how output rise and fall times vary with capacitance. The delay and hold specifications given should be derated by a factor derived from these figures. The graphs in these figures may not be linear outside the ranges shown.

Figure 64. Driver Type A Typical Rise and Fall Times (10% to 90%) vs. Load Capacitance

## ENVIRONMENTAL CONDITIONS

To determine the junction temperature on the application printed circuit board, use the following equation:

$$T_J = T_{CASE} + (\Psi_{JT} \times P_D)$$

where:

$T_J$  = Junction temperature (°C).

$T_{CASE}$  = Case temperature (°C) measured by customer at top center of package.

$\Psi_{JT}$  = From Table 68, Table 69, and Table 70.

$P_D$  = Power dissipation (see Total Power Dissipation (PD) on Page 67 for the method to calculate  $P_D$ ).

Table 68. Thermal Characteristics (120-Lead LQFP)

| Parameter     | Condition             | Typical | Unit |
|---------------|-----------------------|---------|------|
| $\theta_{JA}$ | 0 linear m/s air flow | 21.5    | °C/W |
| $\theta_{JA}$ | 1 linear m/s air flow | 19.2    | °C/W |

# ADSP-CM402F/CM403F/CM407F/CM408F/CM409F

Values of  $\theta_{JA}$  are provided for package comparison and printed circuit board design considerations.  $\theta_{JA}$  can be used for a first order approximation of  $T_J$  by the equation:

$$T_J = T_A + (\theta_{JA} \times P_D)$$

where:

$T_A$  = Ambient temperature (°C).

Values of  $\theta_{JC}$  are provided for package comparison and printed circuit board design considerations when an external heat sink is required.

In [Table 68](#) and [Table 69](#), airflow measurements comply with JEDEC standards JESD51-2 and JESD51-6. The junction-to-case measurement complies with MIL-STD-883 (Method 1012.1). All measurements use a 2S2P JEDEC test board.

| ADSP-CM407CSWZ-BF  | 240 MHz         | 11+      | N/A      | -40°C to +105°C                | 176-Lead Low Profile Quad Flat Package, Exposed Pad | SW-176-3       |
| ADSP-CM407CSWZ-DF  | 150 MHz         | 11+      | N/A      | -40°C to +105°C                | 176-Lead Low Profile Quad Flat Package, Exposed Pad | SW-176-3       |
| ADSP-CM408CSWZ-AF  | 240 MHz         | 13+      | 1        | -40°C to +105°C                | 176-Lead Low Profile Quad Flat Package, Exposed Pad | SW-176-3       |
| ADSP-CM408CSWZ-BF  | 240 MHz         | 13+      | N/A      | -40°C to +105°C                | 176-Lead Low Profile Quad Flat Package, Exposed Pad | SW-176-3       |
| ADSP-CM409CBCZ-AF  | 240 MHz         | 13+      | 1        | -40°C to +105°C                | 212-Ball Chip Scale Package Ball Grid Array         | BC-212-1       |

<sup>1</sup>Z = RoHS Compliant Part.

<sup>2</sup>Referenced temperature is ambient temperature. The ambient temperature is not a specification. See [Operating Conditions on Page 64](#) for the junction temperature (T<sub>j</sub>) specification which is the only temperature specification.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
