Notes on Electrical Characteristics:

¹Guaranteed by design and characterization, not 100% tested in production.

²Slew rate measured through Vswing centered around differential zero

³Vxabs is defined as the voltage where CLK = CLK#

⁴Only applies to the differential rising edge (CLK rising and CLK# falling)

⁵Defined as the total variation of all crossing voltages of CLK rising and CLK# falling. Matching applies to rising edge rate of CLK and falling edge of CLK#. It is measured using a +/-75mV window centered on the average cross point where CLK meets CLK#. The average cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.

⁶All Long Term Accuracy and Clock Period specifications are guaranteed assuming that REFOUT is at 14.31818MHz

⁷Operation under these conditions is neither implied, nor guaranteed.

⁸Maximum input voltage is not to exceed maximum VDD
