## Power Good, DC OK, Inhibit Signals and Current Sharing – J2

### 1. Power\_Good: - Output Signal – J2 Pin 6

During normal operation is Logic High, goes HIGH 100-250 ms after main output is in regulation, and goes LOW with 7ms warning time before loss of main output due to loss of AC input.

**Note:** Power\_Good signal is a combination of AC OK (Internal) and DC\_OK such that failure of either one will cause the Power\_Good signal to go low.

Logic High: >4.5V sourcing 16mA  
Logic Low: <0.5V sinking 16mA

Figure 1

### 2. DC\_OK: Output signal – J2 Pin 10

During normal operation, this signal is logic High. It will go logic Low for output less than 90% of its nominal rated voltage.

Logic High: >4.5V sourcing 16mA  
Logic Low: <0.5V sinking 16mA

Figure 2

### 3. Enable: Input signal – J2 Pin 9

Logic High or Open = ON  
Low/ground = OFF

Logic High >3.4V  
Logic Low <1.2V

Internal pull up resistor: 43KΩ to 5V

### 4. PS\_Off: Input signal – J2 Pin 8

Logic Low or Open = ON  
Logic High = OFF

Logic High >3.4V  
Logic Low <1.2V

Internal pull down resistor: 43KΩ to V-.

### 5. Remote Sense Output Signal – J2 Pin 1 (+Sense), J2 Pin 2 (-Sense)

Less than 250mV voltage drop compensation due to cable loss on each side of main output. See Figure 3 for wiring connection.

### 6. Stand-By Output – J2 Pin5 (+), J2 Pin 4 (-)

The standby output is always available when AC input is present. It is rated for 5V/0.2A.

5VSB Always present when AC is On
