

# NE5517, NE5517A, AU5517

## Dual Operational Transconductance Amplifier

The AU5517 and NE5517 contain two current-controlled transconductance amplifiers, each with a differential input and push-pull output. The AU5517/NE5517 offers significant design and performance advantages over similar devices for all types of programmable gain applications. Circuit performance is enhanced through the use of linearizing diodes at the inputs which enable a 10 dB signal-to-noise improvement referenced to 0.5% THD. The AU5517/NE5517 is suited for a wide variety of industrial and consumer applications.

Constant impedance of the buffers on the chip allow general use of the AU5517/NE5517. These buffers are made of Darlington transistors and a biasing network that virtually eliminate the change of offset voltage due to a burst in the bias current  $I_{ABC}$ , hence eliminating the audible noise that could otherwise be heard in high quality audio applications.

### Features

- Constant Impedance Buffers
- $\Delta V_{BE}$  of Buffer is Constant with Amplifier  $I_{BIAS}$  Change
- Excellent Matching Between Amplifiers
- Linearizing Diodes
- High Output Signal-to-Noise Ratio
- Pb-Free Packages are Available\*

### Applications

- Multiplexers
- Timers
- Electronic Music Synthesizers
- Dolby® HX Systems
- Current-Controlled Amplifiers, Filters
- Current-Controlled Oscillators, Impedances

## MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Supply Voltage (Note 1)	$V_S$	44 $V_{DC}$ or $\pm 22$	V
Power Dissipation, $T_{amb} = 25^\circ\text{C}$ (Still Air) (Note 2) NE5517N, NE5517AN NE5517D, AU5517D	$P_D$	1500 1125	mW
Thermal Resistance, Junction-to-Ambient D Package N Package	$R_{\theta JA}$	140 94	$^\circ\text{C}/\text{W}$
Differential Input Voltage	$V_{IN}$	$\pm 5.0$	V
Diode Bias Current	$I_D$	2.0	mA
Amplifier Bias Current	$I_{ABC}$	2.0	mA
Output Short-Circuit Duration	$I_{SC}$	Indefinite	
Buffer Output Current (Note 3)	$I_{OUT}$	20	mA
Operating Temperature Range NE5517N, NE5517AN AU5517T	$T_{amb}$	$0^\circ\text{C}$ to $+70^\circ\text{C}$ $-40^\circ\text{C}$ to $+125^\circ\text{C}$	$^\circ\text{C}$
Operating Junction Temperature	$T_J$	150	$^\circ\text{C}$
DC Input Voltage	$V_{DC}$	$+V_S$ to $-V_S$	
Storage Temperature Range	$T_{stg}$	$-65^\circ\text{C}$ to $+150^\circ\text{C}$	$^\circ\text{C}$
Lead Soldering Temperature (10 sec max)	$T_{slid}$	230	$^\circ\text{C}$

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

- For selections to a supply voltage above  $\pm 22$  V, contact factory.
- The following derating factors should be applied above  $25^\circ\text{C}$   
N package at  $10.6\text{ mW}/^\circ\text{C}$   
D package at  $7.1\text{ mW}/^\circ\text{C}$ .
- Buffer output current should be limited so as to not exceed package dissipation.

APPLICATIONS

Figure 20. Unity Gain Follower

CIRCUIT DESCRIPTION

The circuit schematic diagram of one-half of the AU5517/NE5517, a dual operational transconductance amplifier with linearizing diodes and impedance buffers, is shown in Figure 21.

Transconductance Amplifier

The transistor pair, Q<sub>4</sub> and Q<sub>5</sub>, forms a transconductance stage. The ratio of their collector currents (I<sub>4</sub> and I<sub>5</sub>, respectively) is defined by the differential input voltage, V<sub>IN</sub>, which is shown in Equation 1.

$$V_{IN} = \frac{KT}{q} \ln \frac{I_5}{I_4} \quad (\text{eq. 1})$$

Where V<sub>IN</sub> is the difference of the two input voltages

KT ≅ 26 mV at room temperature (300°k).

Transistors Q<sub>1</sub>, Q<sub>2</sub> and diode D<sub>1</sub> form a current mirror which focuses the sum of current I<sub>4</sub> and I<sub>5</sub> to be equal to amplifier bias current I<sub>B</sub>:

$$I_4 + I_5 = I_B \quad (\text{eq. 2})$$

If V<sub>IN</sub> is small, the ratio of I<sub>5</sub> and I<sub>4</sub> will approach unity and the Taylor series of ln function can be approximated as

$$\frac{KT}{q} \ln \frac{I_5}{I_4} \approx \frac{KT}{q} \frac{I_5 - I_4}{I_4} \quad (\text{eq. 3})$$

$$\text{and } I_4 \approx I_5 \approx I_B$$

$$\frac{KT}{q} \ln \frac{I_5}{I_4} \approx \frac{KT}{q} \frac{I_5 - I_4}{1/2 I_B} = \frac{2KT}{q} \frac{I_5 - I_4}{I_B} = V_{IN} \quad (\text{eq. 4})$$

$$I_5 - I_4 = V_{IN} \frac{(I_B^q)}{2KT}$$

The remaining transistors (Q<sub>6</sub> to Q<sub>11</sub>) and diodes (D<sub>4</sub> to D<sub>6</sub>) form three current mirrors that produce an output current equal to I<sub>5</sub> minus I<sub>4</sub>. Thus:

$$V_{IN} \left( \frac{I_B^q}{2KT} \right) = I_O \quad (\text{eq. 5})$$

The term  $\frac{(I_B^q)}{2KT}$  is then the transconductance of the amplifier and is proportional to I<sub>B</sub>.

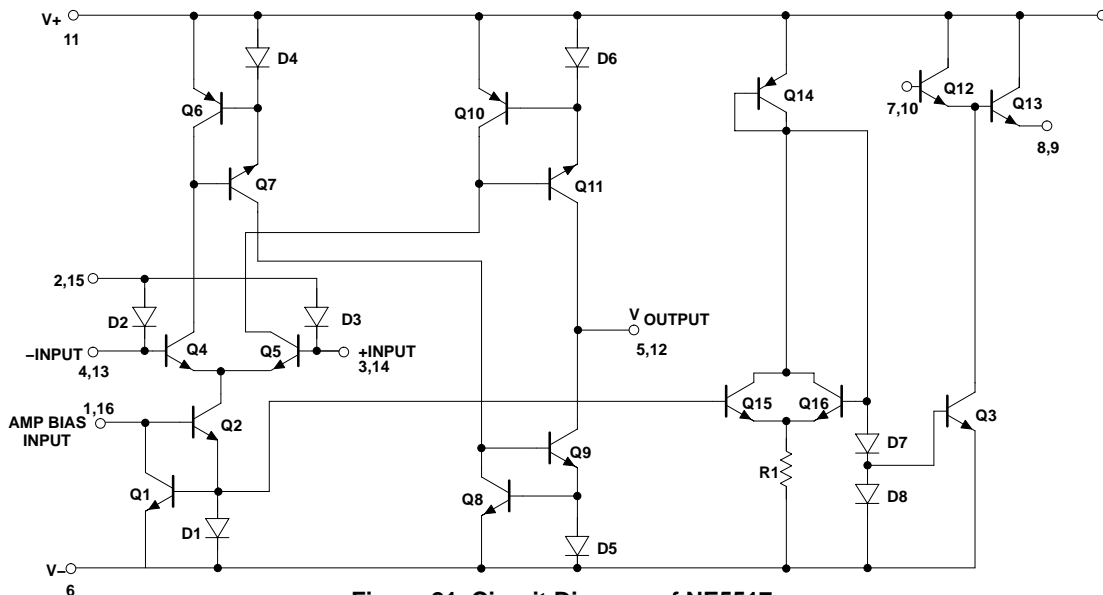

Figure 21. Circuit Diagram of NE5517

**Linearizing Diodes**

For  $V_{IN}$  greater than a few millivolts, Equation 3 becomes invalid and the transconductance increases non-linearly. Figure 22 shows how the internal diodes can linearize the transfer function of the operational amplifier. Assume  $D_2$  and  $D_3$  are biased with current sources and the input signal current is  $I_S$ . Since  $I_4 + I_5 = I_B$  and  $I_5 - I_4 = I_0$ , that is:  $I_4 = (I_B - I_0)$ ,  $I_5 = (I_B + I_0)$

**Figure 22. Linearizing Diode**

For the diodes and the input transistors that have identical geometries and are subject to similar voltages and temperatures, the following equation is true:

$$\frac{T}{q} \ln \frac{\frac{I_D}{2} + I_S}{\frac{I_D}{2} - I_S} = \frac{KT}{q} \ln \frac{1/2(I_B + I_0)}{1/2(I_B - I_0)} \quad (\text{eq. 6})$$

$$I_0 = I_S \frac{2I_B}{I_D} \text{ for } |I_S| < \frac{I_D}{2}$$

The only limitation is that the signal current should not exceed  $I_D$ .

**Impedance Buffer**

The upper limit of transconductance is defined by the maximum value of  $I_B$  (2.0 mA). The lowest value of  $I_B$  for which the amplifier will function therefore determines the overall dynamic range. At low values of  $I_B$ , a buffer with very low input bias current is desired. A Darlington amplifier with constant-current source ( $Q_{14}$ ,  $Q_{15}$ ,  $Q_{16}$ ,  $D_7$ ,  $D_8$ , and  $R_1$ ) suits the need.

**APPLICATIONS**

**Voltage-Controlled Amplifier**

In Figure 23, the voltage divider  $R_2$ ,  $R_3$  divides the input-voltage into small values (mV range) so the amplifier operates in a linear manner.

It is:

$$I_{OUT} = -V_{IN} \cdot \frac{R_3}{R_2 + R_3} \cdot g_M$$

$$V_{OUT} = I_{OUT} \cdot R_L$$

$$A = \frac{V_{OUT}}{V_{IN}} = \frac{R_3}{R_2 + R_3} \cdot g_M \cdot R_L$$

$$(3) g_M = 19.2 I_{ABC}$$

( $g_M$  in  $\mu\text{mhos}$  for  $I_{ABC}$  in mA)

Since  $g_M$  is directly proportional to  $I_{ABC}$ , the amplification is controlled by the voltage  $V_C$  in a simple way.

When  $V_C$  is taken relative to  $-V_{CC}$  the following formula is valid:

$$I_{ABC} = \frac{(V_C - 1.2V)}{R_1}$$

The 1.2 V is the voltage across two base-emitter baths in the current mirrors. This circuit is the base for many applications of the AU5517/NE5517.

TYPICAL VALUES:  $R_1 = 47k\Omega$   
 $R_2 = 10k\Omega$   
 $R_3 = 200\Omega$   
 $R_4 = 200\Omega$   
 $R_L = 100k\Omega$   
 $R_S = 47k\Omega$

**Figure 23.**

# NE5517, NE5517A, AU5517

## Stereo Amplifier With Gain Control

Figure 24 shows a stereo amplifier with variable gain via a control input. Excellent tracking of typical 0.3 dB is easy to achieve. With the potentiometer,  $R_P$ , the offset can be adjusted. For AC-coupled amplifiers, the potentiometer may be replaced with two 510  $\Omega$  resistors.

## Modulators

Because the transconductance of an OTA (Operational Transconductance Amplifier) is directly proportional to  $I_{ABC}$ , the amplification of a signal can be controlled easily. The output current is the product from transconductance  $\times$  input voltage. The circuit is effective up to approximately 200 kHz. Modulation of 99% is easy to achieve.

Figure 24. Gain-Controlled Stereo Amplifier

Figure 25. Amplitude Modulator

# NE5517, NE5517A, AU5517

## Voltage-Controlled Resistor (VCR)

Because an OTA is capable of producing an output current proportional to the input voltage, a voltage variable resistor can be made. Figure 26 shows how this is done. A voltage presented at the  $R_X$  terminals forces a voltage at the input. This voltage is multiplied by  $g_M$  and thereby forces a current through the  $R_X$  terminals:

$$R_x = \frac{R + R_A}{g_M + R_A}$$

where  $g_M$  is approximately 19.21  $\mu$ MHOs at room temperature. Figure 27 shows a Voltage Controlled Resistor using linearizing diodes. This improves the noise performance of the resistor.

## Voltage-Controlled Filters

Figure 28 shows a Voltage Controlled Low-Pass Filter. The circuit is a unity gain buffer until  $X_C/g_M$  is equal to  $R/R_A$ . Then, the frequency response rolls off at a 6dB per octave with the  $-3$  dB point being defined by the given equations. Operating in the same manner, a Voltage Controlled High-Pass Filter is shown in Figure 29. Higher order filters can be made using additional amplifiers as shown in Figures 30 and 31.

## Voltage-Controlled Oscillators

Figure 32 shows a voltage-controlled triangle-square wave generator. With the indicated values a range from 2.0 Hz to 200 kHz is possible by varying  $I_{ABC}$  from 1.0 mA to 10  $\mu$ A.

The output amplitude is determined by  $I_{OUT} \times R_{OUT}$ .

Please notice the differential input voltage is not allowed to be above 5.0 V.

With a slight modification of this circuit you can get the sawtooth pulse generator, as shown in Figure 33.

## APPLICATION HINTS

To hold the transconductance  $g_M$  within the linear range,  $I_{ABC}$  should be chosen not greater than 1.0 mA. The current mirror ratio should be as accurate as possible over the entire current range. A current mirror with only two transistors is not recommended. A suitable current mirror can be built with a PNP transistor array which causes excellent matching and thermal coupling among the transistors. The output current range of the DAC normally reaches from 0 to  $-2.0$  mA. In this application, however, the current range is set through  $R_{REF}$  (10 k $\Omega$ ) to 0 to  $-1.0$  mA.

$$I_{DACMAX} = 2 \cdot \frac{V_{REF}}{R_{REF}} = 2 \cdot \frac{5V}{10k\Omega} = 1mA$$

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
