

MAX270/MAX271

Digitally-Programmed, Dual 2nd-Order Continuous Lowpass Filter

General Description

The MAX270/MAX271 are digitally-programmed, dual second-order continuous-time lowpass filters. Their typical dynamic range of 96dB surpasses most switched capacitor filters which require additional filtering to remove clock noise. The MAX270/MAX271 are ideal for anti-aliasing and DAC smoothing applications and can be cascaded for higher-order responses.

The two filter sections are independently programmable by either microprocessor (μ P) control or pin strapping. Cutoff frequencies in the 1kHz to 25kHz range can be selected.

The MAX270 has an on-board, uncommitted op amp, while the MAX271 has an internal track-and-hold (T/H).

Applications

- Lowpass Filtering
- Anti-Aliasing Filter
- Output Smoothing
- Low-Noise Applications
- Anti-Aliasing and Track-and-Hold (MAX271)

Features

- ◆ Continuous-Time Filtering - No Clock Required
- ◆ Dual 2nd-Order Lowpass Filters
- ◆ Sections Independently Programmable: 1kHz to 25kHz
- ◆ 96dB Dynamic Range
- ◆ No External Components
- ◆ Cascadable for Higher Order
- ◆ Low-Power Shutdown Mode
- ◆ Track-and-Hold (MAX271)

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX270CPP	0°C to +70°C	20 PDIP
MAX270CWP	0°C to +70°C	20 Wide SO
MAX270EPP	-40°C to +85°C	20 PDIP
MAX270EWP	-40°C to +85°C	20 Wide SO
MAX271CNG	0°C to +70°C	20 PDIP
MAX271CWG	0°C to +70°C	20 Wide SO
MAX271ENG	-40°C to +85°C	20 PDIP
MAX271EWG	-40°C to +85°C	20 Wide SO

Devices are available in a lead(Pb)-free/RoHS-compliant package. Specify lead-free by adding a plus (+) to the part number when ordering.

Operating Temperature Ranges:	
MAX27_C_	0°C to +70°C
MAX27_E_	-40°C to +85°C
Storage Temperature Range	-65°C to +165°C
Lead Temperature (soldering, 10s)	+300°C
Soldering Temperature (reflow)	
Lead(Pb)-free	+260°C
Containing lead(Pb)	+240°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

MAX270/MAX271

Digitally-Programmed, Dual 2nd-Order Continuous Lowpass Filter

Detailed Description

Figures 1a, 1b, and 1c show the MAX270/MAX271 functional diagrams. Both the MAX270 and MAX271 contain two independent, second-order, Sallen-Key, lowpass filter sections, A and B to provide a frequency vs. gain rolloff of approximately 40dB/decade. These are not switched-capacitor filters, but have a continuous-time design similar to discrete active filters built around op amps. The MAX270/MAX271 eliminate clock noise and aliasing problems which limit low-noise performance of switched-capacitor filters; resulting dynamic range is over 96dB.

Each filter section contains two banks of programmable capacitors, controlled by an internal 7-bit memory, which set filter cutoff frequencies (f_c) from 1kHz to 25kHz. The filters provide two program modes. In μP mode, cutoff frequencies are programmed by writing 7-bit data to one of two memory addresses (one for each filter section). Alternately, a pin-strap programming mode programs both filter sections simultaneously. In this mode, both memory latches are transparent (not addressable), and data pins D0–D6 may be pin-strapped (hard-wired) to set a common f_c for both filter sections.

The filters are trimmed at the wafer level, setting 0 for a maximum of 0.15dB passband peaking for f_c programmed to 1kHz. Maximum passband peaking at other codes is typically less than 0.15dB. Filter Q is not user-programmable.

The MAX270 includes an uncommitted op amp (noninverting input grounded); the MAX271 has an on-chip T/H that tracks and holds the output of either filter section (selectable). The held output is provided at T/H OUT. T/H functions are controlled by writing control bits to internal registers (in μP mode) or by control pins directly (in pin-strap mode).

The MAX270 and MAX271 provide a low quiescent current shutdown mode controlled by the $\overline{\text{SHDN}}$ pin, which turns off internal amplifiers and disconnects all outputs, reducing quiescent operating current to less than 15 μA . When the MAX271 is in μP mode, shutdown mode is selected by writing control bits to memory (the $\overline{\text{SHDN}}$ pin is disabled).

Pin Description

MAX270

PIN	NAME	FUNCTION
1	OP OUT	Uncommitted Op Amp Output
2	V+	Positive Supply Voltage
3	OUTA	Filter A Output
4	$\overline{\text{SHDN}}$	Shutdown Control. Low level disconnects OUTA, OUTB, and OP OUT and places device into shutdown mode.
5	INA	Filter A Input
6	V-	Negative Supply Voltage
7	INB	Filter B Input
8	OUTB	Filter B Output
9	GND	Ground
10	$\overline{\text{WR}}$	Write Control Input. A low level writes data D0–D6 to program memory addressed by A0. High level latches data.
11	CS	Chip-Select Input. Must be low for $\overline{\text{WR}}$ input to be recognized.
12	A0	Three-Level Address Input Logic High: Addresses filter A Logic Low: Addresses filter B Connect to V-: Pin-strap mode
13-19	D0–D6	7-Bit Data Inputs. Allows programming of 128 cutoff frequencies in a 1kHz to 25kHz range.
20	OP IN	Uncommitted Op Amp Input

Note: All digital input levels are TTL and CMOS compatible, unless otherwise noted.

MAX270/MAX271

Digitally-Programmed, Dual 2nd-Order Continuous Lowpass Filter

Pin Description (continued)

MAX271

PIN	NAME	FUNCTION, FP MODE (MODE = GND OR V-)	FUNCTION, FP MODE (MODE = GND OR V+)
1	T/H OUT	Track-and-Hold Output	
2	V+	Positive Supply Voltage	
3	OUTA	Filter A Signal Output	
4	$\overline{\text{SHDN}}$	—	$\overline{\text{SHUTDOWN}}$ Control. A low level disconnects outputs and places device into shutdown mode
5	INA	Filter A Signal Input	
6	V-	Negative Supply Voltage	
7	INB	Filter B Signal Input	
8	MODE	Selects μP mode when connected to GND or V- and pin-strap mode when connected to V+.	
9	OUTB	Filter B Signal Output	
10	GND	Ground	
11	T/H A/ $\overline{\text{B}}$	—	Track-and-Hold Input Control. A high/low level internally connects OUTNOUTB to input of Track-and-Hold
12	$\overline{\text{WR}}$	$\overline{\text{WRITE}}$ Control Input. A low level writes data D0-D6 program memory addressed by A1, A0 (or performs function as described for address inputs). High level latches data.	—
13	T/H EN	X	Track-and-Hold Output Control. Low level disconnects T/H OUT. Connect pin high for normal operation
14	$\overline{\text{CS}}$	Chip Select Input. Must be low for $\overline{\text{WR}}$ input to be recognized.	—
15, 16	A1, A0	Address and μP Control Inputs. 0, 0 Programs f_C , filter A 0, 1 Programs f_C , filter B 1, 0 Controls T/H functions: D0 performs T/H En pin function D1 performs T/H A/ $\overline{\text{B}}$ pin function. 1, 1 Controls device shutdown: D0 performs $\overline{\text{SHDN}}$ pin function Note: The $\overline{\text{WR}}$ pin must be strobed low to initiate a program/function (Figure 2).	—
17-23	D0–D6	7-bit Data Inputs. Allows programming of 128 cutoff frequencies (also performs control functions as described above).	7-bit Data Inputs. Program memory latches are transparent in this mode. Connect pins high or low to program filters A and B simultaneously to the same f_C .
24	$\overline{\text{T/H}}$	Track-and-Hold Control. Low level causes T/H OUT to track selected filter output. Filter output level held at T/H OUT synchronous with $\overline{\text{T/H}}$ rising transition.	

X = Pin has no function in this mode.

Note: All digital input levels are TTL and CMOS compatible, unless otherwise noted.

Filter Programming Cutoff Frequency

f_C is the frequency of 3dB attenuation in the filter response.

Table 1 shows how data pins D0–D6 allow programming of 128 cutoff frequencies from 1kHz to 25kHz.

The equations for calculating f_C from the programmed code are as follows:

$$f_C = \frac{87.5}{87.5 - \text{CODE}} \times 1\text{kHz} \quad \text{for codes 0 - 63} \\ (f_C = 1\text{kHz to } 3.57\text{kHz})$$

$$f_C = \frac{262.5}{137.5 - \text{CODE}} \times 1\text{kHz} \quad \text{for codes 64 - 127} \\ (f_C = 3.57\text{kHz to } 25\text{kHz})$$

where CODE is the data on pins D0–D6 (0–127). D6 is the most significant bit (MSB).

Actual cutoff frequencies are subject to some error for each programmed code. Highest accuracy occurs at CODE = 0 where filters are trimmed for a 1kHz cutoff frequency. At higher codes, CODE vs. f_C errors increase; the frequency error at CODE = 127 (highest code) remains typically within $\pm 9.5\%$. This means that the actual filter cutoff frequency, when programmed to CODE = 127, falls between 22.63kHz and 27.38kHz.

MAX270/MAX271

Digitally-Programmed, Dual 2nd-Order Continuous Lowpass Filter

Programmed code is the data on pins D0–D6 (0–127). D6 is the MSB.

MAX270/MAX271

Digitally-Programmed, Dual 2nd-Order Continuous Lowpass Filter

MAX270 Control Interface

The A0 pin is a three-level input that selects the memory addresses for updating cutoff frequency data in μ P mode:

A0	SELECTS
Logic Low	Filter B
Logic High	Filter A

Figure 2 shows μ P-mode interface timing.

Connecting A0 to the negative supply selects pin-strap mode. Pin-strap mode allows filter programming with no timing requirements. Internal memory latches are disabled, permitting filters A and B to be programmed directly to f_C data strapped on D0–D6. This mode disables \overline{CS} and \overline{WR} controls, and filters A and B are programmed to the same f_C .

A low level on the \overline{SHDN} pin shuts down all amplifiers and disconnects OUTA, OUTB, and OP OUT. Current consumption drops to less than 15 μ A in this mode.

MAX271 Control Interface

Connecting the MODE pin to GND or V- selects the μ P mode. In this mode, addressable program memory controls filter cutoff frequency programming and all T/H functions, except T/H. See the Figure 2 for timing characteristics. Table 2 describes available functions:

Figure 2. MAX270/MAX271 Digital Timing Diagram

In μ P mode, \overline{SHDN} , T/H A/ \overline{B} , and T/H EN pins are disabled. T/H remains enabled and performs the T/H tracking/holding function.

Tying MODE to V+ selects pin-strap mode. In this mode, both memory latches are transparent, and data on D0–D6 controls the f_C of filters A and 8 directly (filters A and 8 are programmed to the same f_C). Pin strap D0–D6 for operation without μ P. A0, A1, \overline{CS} , and \overline{WR} are disabled.

Table 2. MAX271 μ P-Mode Interface

A1	A0	06	05	04	03	02	01	D0	FUNCTION
0	0	7-bit f_C data							Selects filter A
0	1	7-bit f_C data							Selects filter B
1	0	X	X	X	X	X	X	0	T/H OUT disabled
1	0	X	X	X	X	X	X	1	T/H OUT enabled
1	0	X	X	X	X	X	0	X	Selects OUTB as input to T/H
1	0	X	X	X	X	X	1	X	Selects OUTA as input to T/H

X = Don't care

MAX270/MAX271

Digitally-Programmed, Dual 2nd-Order Continuous Lowpass Filter

Digital Threshold Levels

All digital inputs are TTL and CMOS compatible, unless otherwise stated. Inputs are CMOS gates with less than 1µA leakage current and 8pF capacitance loading. Typical logic voltage thresholds are a function of the V+ supply voltage as shown below (voltages are referenced to GND).

V+ (V)	LOGIC THRESHOLD VOLTAGE (V)
8	+2.4
7	+2.3
6	+2.0
5	+1.75
4	+1.5
2.5	+1.0

Note: For +5V single-supply operation, where incoming logic signals are referenced to V-, typical logic thresholds are +3.5V. Therefore, a CMOS (rail-to-rail) logic interface is recommended.

Filter Performance

All MAX270/MAX271 internal amplifier and output stages for filter sections, uncommitted op amp, and T/H are identical. The outputs are designed to drive 5kΩ in parallel with a maximum capacitance of 100pF. At higher load levels, the output swing becomes asymmetric. All outputs can be short circuited to GND for an indefinite duration.

The MAX270/MAX271 operating frequency range is limited to approximately 2MHz by the bandwidth of the internal amplifiers.

Filter Noise

Wideband filter noise over a 50kHz bandwidth is 12µVRMS and 38µVRMS per section for f_C programmed to 1kHz and 25kHz, respectively. A dynamic range of over 96dB results.

Filter Input Impedance

At DC, the input impedance at INA and INB is equal to the DC input impedance of the amplifier, which is about 5MΩ. At higher frequencies, internal capacitors contribute to an effective input impedance that may fall as low as 100kΩ at 25kHz.

MAX271 Track-and-Hold

The MAX271 T/H is functionally equivalent to a switched 200pF capacitor buffered by a unity-gain amplifier (Figures 1b and 1c). When the T/H pin is driven low, the output of filter A or filter B (whichever is selected via control interface) internally connects to the amplifier, and T/H OUT follows the filter output. The offset at T/H OUT (±6mV max) is the combined offset of the filter amplifier and the T/H buffer. When T/H is pulled high, the switch disconnects the filter signal from the T/H. The T/H capacitor holds the stored charge, and that voltage is buffered at T/H OUT.

A low level at T/H EN disconnects T/H OUT, enabling multiplexed operation (Figure 3). T/H A/B selects between OUTA and OUTB as the T/H input. In FP mode, the T/H EN and T/H OUT functions are controlled by writing control bits to program memory, with T/H EN and T/H OUT pins disabled.

See the *Typical Operating Characteristics* graphs for T/H dynamic accuracy.

Applications Information

Power-Supply Configurations

The MAX270/MAX271 power supplies must be properly bypassed. Best performance is achieved if V+ and V- are bypassed to GND with 4.7 μ F electrolytic (tantalum is preferred) and 0.1 μ F ceramic capacitors in parallel. These should be as close as possible to the chip supply pins.

Single supplies in the range of 4.75V to 16V may be used to power the MAX270/MAX271 as shown in Figure 4. Digital logic may be referenced to V- (system ground), but will not maintain TTL compatibility. CMOS (rail-to-rail) logic recommended. For μ P-mode operation with a

single supply, the MAX270 A0 pin must be configured with a voltage divider (Figure 4).

Lowest quiescent current in shutdown mode is achieved when A0 is either at V+ or V-.

Independent f_c Programming Without a μ P

Figure 6 shows how filter sections A and B may be programmed to different cutoff frequencies without the use of a μ P. The MAX690 μ P supervisory circuit provides the proper programming sequence when the circuit is powered up by controlling the 74HC373 data buffer and the MAX270 addressing pin to load independent f_c data for filters A and B.

Maxim Integrated cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim Integrated product. No circuit patent licenses are implied. Maxim Integrated reserves the right to change the circuitry and specifications without notice at any time. The parametric values (min and max limits) shown in the Electrical Characteristics table are guaranteed. Other parametric values quoted in this data sheet are provided for guidance.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
