SLES193C−AUGUST 2006−REVISED FEBRUARY 2007

16-Bit, Low-Power Stereo Audio CODEC With Microphone Bias, Headphone, and Digital Speaker Amplifier

FEATURES

- **Analog Front End:**
  - **Stereo Single-Ended Input With Multiplexer**
  - **Mono Differential Input**
  - **Stereo Programmable Gain Amplifier**
  - **Microphone Boost Amplifier (20 dB) and Bias**
- **Analog BackEnd:**
  - **Stereo/Mono Line Output With Volume**
  - **Stereo/Mono Headphone Amplifier With Volume and Capless Mode**
  - **Stereo/Mono Digital Speaker Amplifier (BTL) With Volume (PCM3793)**
- **Analog Performance:**
  - **Dynamic Range: 93 dB (DAC)**
  - **Dynamic Range: 90 dB (ADC)**
  - **40-mW + 40-mW Headphone Output at R_L = 16 Ω**
  - **700-mW + 700-mW Speaker Output at R_L = 8 Ω**
- **Power Supply Voltage**
  - **1.71 V to 3.6 V for Digital I/O Section**
  - **1.71 V to 3.6 V for Digital Core Section**
  - **2.4 V to 3.6 V for Analog Section**
  - **2.4 V to 3.6 V for Power Amplifier Section**
- **Low Power Dissipation:**
  - **7 mW in Playback, 1.8 V/2.4 V, 48 kHz**
  - **13 mW in Record, 1.8 V/2.4 V, 48 kHz**
  - **30 μW in Power Down**
- **Sampling Frequency: 5 kHz to 50 kHz**
- **Automatic Level Control for Recording**
- **Operation From a Single Clock Input Without PLL**
- **System Clock:**
  - **Common-Audio Clock (256 f_S/384 f_S), 12/24, 13/26, 13.5/27, 19.2/38.4, 19.68/39.36 MHz**
- **Headphone Plug Insert Detection**

- **2 (I^2C) or 3 (SPI) Wire Serial Control**
- **Programmable Function by Register Control:**
  - **Digital Attenuation of DAC: 0 dB to −62 dB**
  - **Power Up/Down Control for Each Module**
  - **6-dB to −70-dB Gain for Analog Outputs**
  - **30-dB to −12-dB Gain for Analog Inputs**
  - **0/20 dB Boost Selectable for Microphone Input**
  - **0-dB to −21-dB Gain for Analog Mixing**
  - **Parameter Settings for ALC**
  - **Three-Band Tone Control and 3D Sound**
  - **High-Pass Filter and Two-Stage Notch Filter**
  - **Analog Mixing**
- **Pop-Noise Reduction Circuit**
- **Short and Thermal Protection Circuit**
- **Package: 5-mm × 5-mm QFN Pacakge**
- **Operation Temperature Range: −40°C to 85°C**

APPLICATIONS
- **Portable Audio Player, Cellular Phone**
- **Video Camcorder, Digital Still Camera**
- **PMP/DMB**

DESCRIPTION

The PCM3793/94 is a low-power stereo CODEC designed for portable digital audio applications. The device integrates stereo digital speaker amplifier, headphone amplifier, line amplifier, line input, boost amplifier, microphone bias, programmable gain control, analog mixing, sound effects, and automatic level control (ALC). It is available in a small-footprint, 5-mm × 5-mm QFN package. The PCM3793/94 accepts right-justified, left-justified, I^2S, and DSP formats, providing easy interfacing to audio DSP, decoder, and encoder chips. Sampling rates up to 50 kHz are supported. The user-programmable functions are accessible through a two- or three-wire serial control port.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ORDERING INFORMATION

PRODUCT	PACKAGE	PACKAGE CODE	OPERATION TEMPERATURE RANGE	PACKAGE MARKING	ORDERING NUMBER[1]	TRANSPORT MEDIA
PCM3793RHB	32 QFN	RHB	–40°C to 85°C	PCM3793	PCM3793RHBT	Small tape and reel
					PCM3793RHBR	Large tape and reel
PCM3794RHB	32 QFN	RHB	–40°C to 85°C	PCM3794	PCM3794RHBT	Small tape and reel
					PCM3794RHBR	Large tape and reel

(1) For the most current specification and package information, see the TI Web site at www.ti.com.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)[1]

		PCM3793/94	UNIT
Supply voltage	V_{DD}, V_{IO}, V_{CC}, V_{PA}	–0.3 to 4	V
Ground voltage differences: DGND, AGND, PGND		±0.1	V
Input voltage		–0.3 to 4	V
Input current (any pins except supplies and SPK out)		±10	mA
Ambient temperature under bias		–40 to 110	°C
Storage temperature		–55 to 150	°C
Junction temperature		150	°C
Lead temperature (soldering)		260	°C, 5 s
Package temperature (reflow, peak)		260	°C

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V_{CC}, V_{PA}	Analog supply voltage		2.4	3.3	3.6	V
V_{DD} , V_{IO}	Digital supply voltage		1.71	3.3	3.6	V
	Digital input logic family			CMOS		
	Digital input clock frequency	SCKI system clock	3.072		18.432	MHz
		LRCK sampling clock	8		48	kHz
	Analog output load resistance	LOL and LOR	10			kΩ
		HPOL and HPOR	16			Ω
		SPOLP, SPOLN, SPORP and SPORN	8			Ω
	Analog output load capacitance				30	pF
	Digital output load capacitance				10	pF
T_A	Operating free-air temperature		–40		85	°C

SLES193C−AUGUST 2006−REVISED FEBRUARY 2007

TEXAS
INSTRUMENTS
www.ti.com
PCM3793/94 DESCRIPTION

Analog Input

The AIN1L, AIN1R, AIN2L, AIN2R, AIN3L, and AIN3R pins can be used as microphone or line inputs with selectable 0- or 20-dB boost and 1-Vrms input. All analog inputs have high input impedance (20 kΩ), which is not changed by gain settings. One pair of inputs is selected by register 87 (AIL[1:0], AIR[1:0]). AIN1L and AIN1R can be used as monaural differential inputs.

Gain Settings for Analog Input

Analog signals can be adjusted from 30 dB to −12 dB in 1-dB steps following the 0- or 20-dB boost amplifier. The gain level can be set for each channel by registers 79 and 80 (ALV[5:0], ARV[5:0]).

A/D Converter

The ADC includes a multilevel delta-sigma modulator, aliasing filter, decimation filter, high-pass filter, and notch filter and can accept a 1-Vrms full-scale voltage input. The decimation filter has a digital soft mute controlled by register 81 (RMUL, RMUR). The high-pass filter can be disabled by register 81 (HPF[1:0]) and the notch filter can be disabled by registers 96 to 104 if it is not necessary to cancel a dc offset or compensate for wind noise.

D/A Converter

The DAC includes a multilevel delta-sigma modulator and interpolation filter. These can be used to obtain high PSRR, low jitter sensitivity, and low out-of-band noise quickly and easily. The interpolation filter includes digital attenuator, digital soft mute, three-band tone control (bass, midrange and treble), and 3-D sound controlled by registers 92 to 95. The de-emphasis filter (32, 44.1 and 48 kHz) is controlled by registers 68 to 70 (ATL[5:0], ATR[5:0], PMUL, PMUR, DEM[1:0]). Oversampling rate control can reduce out-of-band noise when operating at low sampling rate by using register 70 (OVER).

Common Voltage

The V_{COM} pin is normally biased to 0.5 V_{CC}, and it provides the common voltage to internal circuitry. It is recommended that a 10-µF capacitor be connected between this pin and ground to provide clean voltage and avoid pop noise. The PCM3793/94 may have a little pop noise on each analog output if a capacitor smaller than 10 µF is used.

Line Output

The HPOL/LOL and HPOR/LOR and HPCOM/MONO pins can be used as a monaural single-ended, monaural differential, or stereo single-line output with 1-V_{rms} output by register 74 (HPS[1:0]). The line outputs can drive a 10-kΩ load. These outputs include an analog volume amplifier, except for the HPCOM/MONO pin that can be set from 6 dB to −70 dB and mute with 0.5-, 1-, 2- or 4-dB steps for each output, as controlled by registers 64 and 65 (HLV[5:0], HRV[5:0], HMUL, HMUR). A dc blocking capacitor is not required when connecting to an external speaker amplifier with monaural differential input. The center voltage is 0.5 V_{CC} with zero data input.

Headphone Output

The HPOL/LOL, HPOR/LOR, and HPCOM/MONO pins are stereo, monaural, or monaural differential headphone outputs with more than 30 or 40 mWrms output power into a 32- or 16-Ω load, either through a dc blocking capacitor or without a capacitor, as selected by register 74 (HPS[2:0]). These outputs include analog volume amplifiers, except for the HPCOM/MONO pin, which can be set from 6 dB to −70 dB with 0.5-, 1-, 2- or 4-dB steps for each output using registers 64 and 65 (HLV[5:0], HRV[5:0], HMUL, HMUR). The center voltage is 0.5 V_{CC} with zero data input.

Headphone Plug Insertion Detection

The HDTI pin detects the insertion status of headphone plug and writes the status to register 77 (HPDS), which can be read by the I²C interface. The polarity of the status indication can be inverted by register 75 (HPDP). The headphone and speaker amplifiers are disabled or enabled automatically by headphone plug insertion/extractrion if register 75, HPDE = 1. They are controlled by register settings if register 75, HPDE = 0. HPCOM/MONO is not affected by the status when register 74, CMS[0] = 1.

Speaker Output (Class-D, PCM3793)

The SPOLP, SPOLN and SPORP, SPORN pins are stereo or mono speaker differential outputs (BTL) with a maximum of 700 mWrms (V_{PA} = 3.6 V, volume = 6 dB) into an 8-Ω load. The digital speaker amplifier offers maximum battery life and minimum heat, eliminates the LC low-pass filter, and includes analog volume amplification for each output from 6 dB to –70 dB with 0.5-, 1-, 2- or 4-dB steps, which can be set by register 66, 67 (SLV[5:0], SLR[5:0]). Spectrum spreading technology and selectable switching frequency to reduce EMI noise is controlled by register 71 (DFQ[2:0], SPS[1:0] and SPSE). The speaker amplifiers have a thermal shutdown circuit which detects when the device temperature reaches approximately 150°C; then the speaker amplifier is powered down.

Analog Mixing and Bypass

Mixing amplifiers (MXL, MXR) mix gain-controlled analog inputs from the AIN pins which have bypassed ADC and DAC and direct the mixed signal to the headphone or speaker outputs. Analog mixing is controlled by register 87 (AD2S, AIR[1:0], AIL[1:0]), register 88 (MXR[2:0], MXL[2:0]), and register 89 (GMR[2:0], GML[2:0]). The analog mixing functions are suitable for FM radio, headset, and another analog sources without an ADC.

Microphone Bias

The MICB pin is the microphone bias source for an external microphone and can provide 2 mA (typical) bias current.

Automatic Level Control (ALC) for Recording

The sound for microphone recording should be expanded to a suitable level without saturation. The digitally controlled automatic level control (ALC) provides automatic expansion for small input signals and compression for large input signals while recording. The expansion level, compression level, attack time, and recovery time can be selected by register 83. The register 83 description explains the details of these settings.

3-D Sound

A 3-D sound effect is provided by mixing L-channel and R-channel data with band pass filter that can be controlled two parameters, mixing ratio and band pass filter characteristic by register 95 (3DP[3:0], 3FLO). The 3-D sound effect can be applied to the DAC digital input or ADC digital output, as selected by register 95 (SDAS).

Three-Band Tone Control

Tone control has bass, midrange, and treble controls that can be adjusted from 12 dB to –12 dB in 1-dB steps by registers 92 to 94 (LGA[4:0], MGA[4:0] and HGA[4:0]). Register 92 (LPAE) attenuates the digital input signal automatically to prevent clipping of the output signal at settings above 0 dB for bass control. LPAE has no effect on midrange and treble controls.

High-Pass Filter and Notch Filter

The high-pass filter eliminates the dc offset of the ADC analog signal and can be set for a cutoff frequency of 4 Hz or 240 Hz at of 48-kHz sampling frequency by register 81 (HPF[1:0]). A register 95 (SDAS) selection applies the filter to either the DAC digital input or the ADC digital output.

Notch filters are provided to remove noise of a particular frequency, such as CCD noise, motor noise, or other mechanical noise in a particualr application. The PCM3793/94 has two notch filters for which the center frequency and frequency bandwidth can be programmed by registers 96 to 104. A register 95 (SDAS) selection applies the filter to either the DAC digital input or the ADC digital output.

Digital Monaural Mixing

Register 96 (MXEN) enables or disables the internal mixing of stereo digital data to monaural digital data.

Zero-Cross Detection

Zero-cross detection minimizes audible zipper noise while changing analog volume and digital attenuation. This function can be applied to digital input or digital output by register 86 (ZCRS).

PCM3793
PCM3794

SLES193C – AUGUST 2006 – REVISED FEBRUARY 2007

Short Protection

The short-circuit protection on each headphone output prevents damage to the device while an output is shorted to V_{PA}, an output is shorted to PGND, or any two outputs are shorted together. When the short circuit is detected on the outputs, the PCM3793/94 powers down the shorted amplifier at once. The short-protection status can be monitored by reading register 77 (STHC, STHL, SCHR) through the I²C interface. Short-circuit protection operates in any enabled headphone amplifier.

Thermal Protection

The thermal protection on the speaker amplifier prevents damage to the device when the internal die temperature exceeds approximately 150°C. Once the die temperature exceeds the thermal set point, all analog outputs are powered down. This status can be reset by setting register 76 (RLSR, RLSL) and can be watched by reading register 77 (STSR, STSL) on the two-wire (I²C) interface. Thermal protection operates in any enabled speaker amplifier.

Pop-Noise Reduction Circuit

The pop-noise reduction circuit prevents audible noise when turning the power supply on/off and powering the device up/down in portable applications. It is recommended to establish the register settings in the sequence that is shown in Table 3 and Table 4. No particular external parts are required, and power-supply sequencing is not necessary.

Power Up/Down for Each Module

Using register 72 (PMXL, PMXR), register 73 (PBIS, PDAR, PDAL, PHPC, PHPR, PHPL, PSPR, PSPL), register 82 (PAIR, PAIL, PADS, PMCB, PADR, PADL), and register 90 (PCOM), unused modules can be powered down to minimize power consumption (7 mW during playback only and 13 mW when recording only).

Digital Interface

All digital I/O pins can interface at various power supply voltages. The V_{IO} pin can be connected to a 1.71-V to 3.6-V power supply.

Power Supply

The V_{CC} pin and the V_{PA} pin can be connected to 2.4 V to 3.6 V. The same voltage must be applied to both pins. The V_{DD} pin and the V_{IO} pin can be connected to 1.71 V to 3.6 V. A different voltage can be applied to each of these pins (for example, V_{DD} = 1.8 V, V_{IO} = 3.3 V).

DESCRIPTION OF OPERATION

System Clock Input

The PCM3793/94 can accept clocks of various frequencies without a PLL. They are used for clocking the digital filters and automatic level control and delta-sigma modulators and are classified as common-audio and application-specific clocks. Table 2 shows frequencies of the common-audio clock and application-specific clock. Figure 25 shows the timing requirements for system clock inputs. The sampling rate and frequency of the system clocks are determined by the settings of register 86 (MSR[2:0]) and register 85 (NPR[5:0]). Note that the sampling rate of the application-specific clock has a little sampling error.

Table 2. System Clock Frequencies

CLOCK	FREQUENCIES
Common-audio clock	11.2896, 12.288, 16.9344, 18.432 MHz
Application-specific clock	12, 13, 13.5, 24, 26, 27, 19.2, 19.68, 38.4, 39.36 MHz
PARAMETERS	SYMBOL	MIN	UNITS
System-clock pulse duration, high	$t_{w(SCKH)}$	7	ns
System-clock pulse duration, low	$t_{w(SCKL)}$	7	ns

Figure 25. System Clock Timing

Power-On Reset and System Reset

The power-on-reset circuit outputs a reset signal, typically at V_{DD} = 1.2 V, and this circuit does not depend on the voltage of other power supplies (V_{CC}, V_{PA} and V_{IO}). Internal circuits are cleared to default status, then signals are removed from all analog and digital outputs. The PCM3793/94 does not require any power supply sequencing. Register data must be written after turning all power supplies on.

System reset is enabled by setting register 85 (SRST), and all register are cleared automatically. All circuits are reset to their default status at once. Note that the PCM3793/94 has audible pop noise on the analog outputs when enabling SRST.

Power On/Off Sequence

To reduce audible pop noise, a sequence of register settings is required after turning all power supplies on when powering up, or before turning the power supplies off when powering down. If some modules are not required for a particular application or operation, they should be placed in the power-down state after performing the power-on sequence. The recommended power-on and power-off sequences are shown in Table 3 and Table 4, respectively.

Table 3. Recommended Power-On Sequence

STEP	REGISTER SETTINGS	NOTE
1	–	Turn on all power supplies[1]
2	4027h	Headphone amplifier L-ch volume (–6 dB)[2]
3	4127h	Headphone amplifier R-ch volume (–6 dB)[2]
4	4227h	Speaker amplifier L-ch volume (–6 dB)[2]
5	4327h	Speaker amplifier R-ch volume (–6 dB)[2]
6	4427h	Digital attenuator L-ch (–24 dB)[2]
7	4527h	Digital attenuator R-ch (–24 dB)[2]
8	4620h	DAC audio interface format (left-justified)[3]
9	4BC0h	Headphone detection enable and inverting polarity. Short and thermal detection enable
10	5102h	ADC audio interface format (left-justified)[3]
11	5A10h	V_{COM} ramp up/down time control. PG1, PG2 gain control (0 dB)
12	49E0h	DAC (DAL, DAR) and analog bias power up
13	5601h	Zero-cross detection enable
14	4803h	Analog mixer (MXL, MXR) power up
15	5811h	Analog mixer input (SW2, SW5) select
16	49FCh	Headphone amplifier (HPL, HPR, HPC) power up

(1) Power supply sequencing is not required. It is recommended to set register data with system clock input after turning all power supplies on.
(2) Any level is acceptable for volume or attenuation. Level should be resumed by register data recorded when system power off.
(3) Audio interface format should be set to match the DSP or decoder being used.

PCM3793 is Not Recommended for New Designs

SLES193C−AUGUST 2006−REVISED FEBRUARY 2007

Table 3. Recommended Power-On Sequence (continued)

STEP	REGISTER SETTINGS	NOTE
17	4C03h	Speaker amplifier shut down release
18	4A01h	V_{COM} power up
19	523Fh	Analog front end (ADL, ADR, D2S, MCB, PG1, 2, 5, 6) power up
20	5711h	Analog input (MUX3, MUX4) select. Analog input (MUX1, MUX2) select
21	4F0Ch	Analog input L-ch (PG3) volume (0 dB)[2]
22	500Ch	Analog input R-ch (PG4) volume (0 dB)[2]
23	–	Any settings for other devices or wait time[4][5]
24	49FFh	Speaker amplifier (SPL, SPR) power up [5]

(4) The PCM3793 requires time for V_{COM} to reach the common level from GND level. The delay depends on the capacitor value for V_{COM} and the setting of register 90 CMT[1:0]. Wait time [s] = $4 \times C_{VCOM} \times R_{CMT}$
(5) The PCM3794 does not require this setting because it has no speaker output.

Table 4. Recommended Power-Off Sequence

STEP	REGISTER SETTINGS	NOTE

5	49FFh	Headphone amplifier (HPL, HPR, HPC) power up [4], speaker amplifier (SPL, SPR) power up[3][4]
6	5200h	Analog front end (ADL, ADR, D2S, MCB, PG1, 2, 5, 6) power down
7	5A10h	V_{COM} ramp up/down time control, PG1, PG2 gain control (0 dB)
8	4A00h	V_{COM} power down
9	–	Wait time (100 ms)
10	5A00h	V_{COM} ramp up/down time control
11	–	Wait time (100 ms)
12	5A20h	V_{COM} ramp up/down time control
13	–	Wait time (4000 ms)
14	5A30h	V_{COM} ramp up/down time control
15	49E0h	Headphone amplifier (HPL, HPR, HPC) power down, speaker amplifier (SPL, SPR) power down
16	4800h	Analog mixer (MXL, MXR) power down
17	4900h	DAC (DAL, DAR) and analog bias power down
18	–	Turn off all power supplies[5]

(1) Any level is acceptable for volume or attenuation.
(2) Audio interface format should be set according to DSP or decoder.
(3) PCM3794 has no speaker amplifier.
(4) These modules must be powered up during the power-down sequence.
(5) Power supply sequencing is not required. It is recommended to turn off all power supply after register settings with system clock input.

Power-Supply Current

The current consumption of the PCM3793/94 depends on power up/down status of each circuit module. In order to reduce the power consumption, disabling each module is recommended when it is not used in an application or operation. Table 5 shows the current consumption in some states.

Audio Serial Interface

The audio serial interface for the PCM3793/94 comprises LRCK, BCK, DIN, and DOUT. Sampling rate (f_S), left and right channel are present on LRCK. DIN receives the serial data for the DAC interpolation filter, and DOUT transmits the serial data from the ADC decimation filter. BCK clocks the transfer of serial audio data on DIN and DOUT in its high-to-low transition. BCK and LRCK should be synchronized with audio system clock. Ideally, it is recommended that they be derived from it.

The PCM3793/94 requires LRCK to be synchronized with the system clock. The PCM3793/94 does not require a specific phase relationship between LRCK and the system clock.

The PCM3793/94 has both master mode and slave mode interface formats, which can be selected by register 84, MSTR. In master mode, the PCM3793/94 generates LRCK and BCK from the system clock.

Audio Data Formats and Timing

The PCM3793/94 supports I²S, right-justified, left-justified and DSP formats. The data formats are shown in Figure 28 and are selected using register 70 (RFM[1:0], PFM[1:0]). All formats require binary 2s-complement, MSB-first audio data. The default format is I²S. Figure 26 shows a detailed timing diagram.

Figure 28. Audio Data Input and Output Formats

THREE-WIRE INTERFACE (SPI, MODE (PIN 28) = LOW)

All write operations for the serial control port use 16-bit data words. Figure 29 shows the control data word format. The most significant bit must be 0. There are seven bits, labeled IDX[6:0], that set the register address for the write operation. The least significant eight bits, D[7:0], contain the data to be written to the register specified by IDX[6:0].

Figure 30 shows the functional timing diagram for writing to the serial control port. To write the data into the mode register, the data is clocked into an internal shift register on the rising edge of the MC clock. The serial data should change on the falling edge of MC clock and should be LOW during write mode. The rising edge of MS should be aligned with the falling edge of the last MC clock pulse in the 16-bit frame. MC can run continuously between transactions while MS is in the LOW state.

TWO-WIRE INTERFACE [I^{2}C, MODE (PIN 28) = HIGH]

The PCM3793/94 supports the I^{2}C serial bus and the data transmission protocol for the I^{2}C standard as a slave device. This protocol is explained in I^{2}C specification 2.0.

In I^{2}C mode, the control terminals are changed as follows.

TERMINAL NAME	PROPERTY	DESCRIPTION
MS/ADR	Input	I^{2}C address
MD/SDA	Input/output	I^{2}C data
MC/SCL	Input	I^{2}C clock

SLAVE ADDRESS

MSB   LSB

1	0	0	0	1	1	ADR	R/$\overline{W}$

The PCM3793/94 has its own 7-bit slave address. The first six bits (MSBs) of the slave address are factory preset to 100011. The last bit of the address byte is the device select bit, which can be user-defined by the ADR terminal. A maximum of two PCM3793/94s can be connected on the same bus at one time. Each PCM3793/94 responds when it receives its own slave address.

Submit Documentation Feedback

Packet Protocol

The master device must control packet protocol, which consists of start condition, slave address with read/write bit, data if write or acknowledgement if read, and stop condition. The PCM3793/94 supports only slave receiver and slave transmitter.

R0002-01

Figure 33. Framework for Write Operation

READ OPERATION

A master can read the PCM3793/94 register. The value of the register address is stored in an indirect index register in advance. The master sends a PCM3793/94 slave address with a read bit after storing the register address. Then the PCM3793/94 transfers the data which the index register points to. Figure 34 shows a diagram of the write operation.

	PARAMETERS	CONDITIONS	MIN	MAX	UNIT
f_{SCL}	SCL clock frequency	Standard		100	kHz
$t_{(BUF)}$	Bus free time between a STOP and START condition	Standard	4.7		µs
$t_{(LOW)}$	Low period of the SCL clock	Standard	4.7		µs
$t_{(HI)}$	High period of the SCL clock	Standard	4		µs
$t_{(RS-SU)}$	Setup time for START condition	Standard	4.7		µs
$t_{(S-HD)}$	Hold time for START condition	Standard	4		µs
$t_{(D-SU)}$	Data setup time	Standard	250		ns
$t_{(D-HD)}$	Data hold time	Standard	0	900	ns
$t_{(SCL-R)}$	Rise time of SCL signal	Standard	$20 + 0.1\,C_B$	1000	ns
$t_{(SCL-R1)}$	Rise time of SCL signal after a repeated START condition and after an acknowledge bit	Standard	$20 + 0.1\,C_B$	1000	ns
$t_{(SCL-F)}$	Fall time of SCL signal	Standard	$20 + 0.1\,C_B$	1000	ns
$t_{(SDA-R)}$	Rise time of SDA signal	Standard	$20 + 0.1\,C_B$	1000	ns
$t_{(SDA-F)}$	Fall time of SDA signal	Standard	$20 + 0.1\,C_B$	1000	ns
$t_{(P-SU)}$	Setup time for STOP condition	Standard	4		µs
C_B	Capacitive load for SDA and SCL line			400	pF
$t_{(SP)}$	Pulse duration of suppressed spike			25	ns

USER-PROGRAMMABLE MODE CONTROLS

Register Map

The mode control register map is shown in Table 6. Each register includes an index (or address) indicated by the IDX[6:0] bits.

Table 6. Mode Control Register Map

REGISTER	IDX[6:0] (B14–B8)	DESCRIPTION	B7	B6	B5	B4	B3	B2	B1	B0

IDX[6:0]: 100 0001b (41h): Register 65

HMUL: Analog Mute Control for HPL (Line or Headphone L-Channel)

HMUR: Analog Mute Control for HPR (Line or Headphone R-Channel)

Default value: 1

HPOL/LOL and HPOR/LOR can be independently muted to zero level when HMUL and HMUR = 1. The HMUx mute takes precedence over analog volume level settings.

HMUL, HMUR = 0	Mute disabled
HMUL, HMUR = 1	Mute enabled (default)

HLV[5:0]: Analog Volume for HPL (Headphone L-Channel)

HRV[5:0]: Analog Volume for HPR (Headphone R-Channel)

Default value: 00 0000.

HPOL/LOL and HPOR/LOR can be independently controlled from 6 dB to −70 dB, with step size depending on the gain level. Outputs may have zipper noise while changing levels. In the PCM3793/94, the noise can be reduced when making the change by using zero-cross detection (register 85, ZCRS).

IDX[6:0]: 100 0100b (44h): Register 68

IDX[6:0]: 100 0101b (45h): Register 69

PMUL: Digital Soft Mute Control for DAL (DAC, L-Channel)

PMUR: Digital Soft Mute Control for DAR (DAC R-Channel)

Default value: 0

The digital input to the DAC can be independently muted or unmuted. The transition from the current volume level to mute, or the return to the previous volume setting from mute, occurs at the rate of one 1-dB step for each $8/f_S$ time period. When PMUL and PMUR = 0, the digital data is increased from mute to the previous attenuation level, and when PMUL and PMUR = 1, the digital data is decreased from the current attenuation level to mute. In the PCM3793/94, audible zipper noise can be reduced by using zero-cross detection (register 85, ZCRS).

PMUL, PMUR = 0	Mute disabled (default)
PMUL, PMUR = 1	Mute enabled

ATL[5:0]: Digital Attenuation Setting for DAL (L-Channel DAC)

ATR[5:0]: Digital Attenuation Setting for DAR (R-Channel DAC)

Default value: 11 1111b

The digital inputs to the DAC can be independently attenuated. The attenuation of each digital input is controlled in 1-dB step for every $8/f_S$ time period. Audible zipper noise in the PCM3793/94 can be reduced by changing the attenuation with zero-cross detection (register 85, ZCRS).

Table 9. Digital Attenuation Setting

IDX[6:0]: 100 0110b (46h): Register 70

DEM[1:0]: De-Emphasis Filter Selection

Default value: 00

The digital de-emphasis filter is in front of the interpolation filter. One of three de-emphasis filters can be selected, corresponding to sampling rate, 32 kHz, 44.1 kHz, or 48 kHz.

DEM[1:0]	De-Emphasis Filter Selection
00	OFF (default)
01	32 kHz
10	44.1 kHz
11	48 kHz

PFM[1:0]: Audio Interface Selection for DAC (Digital Input)

Default value: 00

The audio interface for the DAC digital input has I^2S, right-justified, left-justified, and DSP formats.

PFM[1:0]	Audio Interface Selection for DAC Digital Input
00	I^2S format (default)
01	Right-justified format
10	Left-justified format
11	DSP format

OVER: Oversampling Control for Delta-Sigma DAC

Default value: 0

This bit is used to control the oversampling rate of delta-sigma DAC. When the PCM3793/94 operates at low sampling rates, less than 24 kHz with SCKI frequency less than 12.5 MHz, using this function with OVER = 1 is recommended.

OVER = 0	$128 f_S$ (default)
OVER = 1	$192 f_S$, $256 f_S$, $384 f_S$

IDX[6:0]: 100 0111b (47h): Register 71

SPSE: Enable of Spectrum Spreading

Default value: 0

The class-D speaker amplifier output can cause RF interference due to switching noise. The PCM3793 can reduce peak noise by the use of spectrum spreading technology when SPSE = 1.

SPSE = 0	Disable (default)
SPSE = 1	Enable

SPS[1:0]: Spectrum Spreading Efficiency

Default value: 00

The efficiency of spectrum spreading technology can be changed to low, medium, or high.

SPS[1:0]	Spectrum Spreading Efficiency
00	Low (default)
01	Medium
10	High
11	Reserved

DFQ[1:0]: Switching Frequency for Speaker Amplifier (Class-D)

Default value: 00

Switching frequency for the class-D speaker amplifier can be selected to avoid interference with other equipment.

DFQ[1:0]	Class D Amplifier Switching Frequency
00	1.5 MHz (default)
01	2.25 MHz
10	2.65 MHz
11	3 MHz

	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
Register 72	0	IDX6	IDX5	IDX4	IDX3	IDX2	IDX1	IDX0	RSV	RSV	RSV	RSV	RSV	RSV	PMXR	PMXL

IDX[6:0]: 100 1000b (48h) Register 72

PMXR: Power Up/Down for MXR (Mixer R-Channel)

PMXL: Power Up/Down for MXL (Mixer L-Channel)

Default value: 0

These bits are used to control power up and down for the analog mixer.

PMXL, PMXR = 0	Power down (default)
PMXL, PMXR = 1	Power up

	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
Register 73	0	IDX6	IDX5	IDX4	IDX3	IDX2	IDX1	IDX0	PBIS	PDAR	PDAL	PHPC	PHPR	PHPL	PSPR	PSPL

IDX[6:0]: 100 1001b (49h): Register 73

PBIS: Power Up/Down Control for Bias

Default value: 0

This bit is used to control power up/down for the analog bias circuit.

PBIS = 0	Power down (default)
PBIS = 1	Power up

PDAR: Power Up/Down Control for DAR (DAC and R-Channel Digital Filter)

PDAL: Power Up/Down Control for DAL (DAC and L-Channel Digital Filter)

Default value: 0

This bit is used to control power up/down for the DAC and interpolation filter.

PDAR, PDAL = 0	Power down (default)
PDAR, PDAL = 1	Power up

PHPC: Power Up/Down Control for HPC (Headphone COM/Monaural Output)

Default value: 0

This bit is used to control power up/down for the headphone COM or monaural line amplifier.

PHPC = 0	Power down (default)
PHPC = 1	Power up

PHPR: Power Up/Down Control for HPR (Line or R-Channel Headphone Output)

PHPL: Power Up/Down Control for HPL (Line or L-Channel Headphone Output)

Default value: 0

This bit is used to control power up/down for the headphone amplifier.

PHPR, PHPL = 0	Power down (default)
PHPR, PHPL = 1	Power up

PSPR: Power Up/Down Control for SPR (R-Channel Speaker Output, PCM3793)

PSPL: Power Up/Down Control for SPL (L-Channel Speaker Output, PCM3793)

Default value: 0

This bit is used to control power up/down for the PCM3793 speaker amplifier. This bit is should be set to 0 for the PCM3794, because it has no speaker outputs.

PSPR, PSPL = 0	Power down (default)
PSPR, PSPL = 1	Power up

IDX[6:0]: 100 1010b (4Ah): Register 74

CMS[2:0]: Output Selection for HPC (Headphone COM/Monaural Output)

Default value: 000

HPCOM/MONO output can be selected from several input analog sources, including inverted HPOR output, inverted HPOL output, and monaural output.

CMS[2:0]	HPCOM/MONO Output Selection
0 0 0	Common voltage (0.5 V_{CC}) output for capless mode (default)
0 0 1	Monaural output
0 1 0	Inverted HPOL output
1 0 0	Inverted HPOR output
Others	Reserved

HPS[1:0]: Line or Headphone Output Configuration

Default value: 00

The HPOL/LOL and HPOR/LOR output configuration can be selected as follows.

HPS[1:0]	Line or Headphone Output Configuration
0 0	Stereo output (default)
0 1	Single monaural output
1 0	Differential monaural output
1 1	Reserved

SPKS: Speaker Output Configuration

Default value: 00

The SPOLP/SPOLN and SPORP/SPORN output configuration can be selected as follows.

SPKS = 0	Stereo output (default)
SPKS = 1	Monaural output

PCOM: Power Up/Down Control for V_{COM}

Default value: 0

This bit is used to control power up/down for V_{COM}.

PCOM = 0	Power down (default)
PCOM = 1	Power up

PCM3793 is Not Recommended for New Designs

IDX[6:0]: 100 1100b (4Ch): Register 76

RLSR: Reset Thermal Protection Circuit for SPR (R-Channel Speaker Amplifier)

RLSL: Reset Thermal Protection Circuit for SPL (L-Channel Speaker Amplifier)

Default value: 0

Short-circuit protection puts the device in power-down status after it detects a temperature of approximately 150°C on the die. These bits must be set to 1 to restore power to the speaker amplifier.

RLSR, RLSL = 0	Operation (default)
RLSR, RLSL = 1	Reset (set to 0 automatically after being set to 1)

	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
Register 77	0	IDX6	IDX5	IDX4	IDX3	IDX2	IDX1	IDX0	HPDS	RSV	RSV	STHC	STHR	STHL	STSR	STSL

IDX[6:0]: 100 1101b (4Dh): Register 77

HPDS: Headphone Detection Status

Default value: 0

The HPDS bit shows the status of insert detection for the headphone. This is a read-only bit. The polarity depends on register 75 HPDP setting.

HPDS = 0	HDTI input (when HPDP = 0) (default)
HPDS = 1	Inverted HDTI input (When HPDP = 1)

STHC: Short Protection Status for HPC (Headphone COM/Monaural Output)

STHR: Short Protection Status for HPR (R-Channel Headphone)

STHL: Short Protection Status for HPL (L-Channel Headphone)

These bits can be read through the I^{2}C interface to determine short protection status.

STHC, STHR, STHL = 0	Detect short circuit
STHC, STHR, STHL = 1	Not detect short circuit

STSR: Thermal Protection Status for SPR (R-Channel Speaker)

STSL: Thermal Protection Status for SPL (L-Channel Speaker)

These bits can be read through the I^{2}C interface to determine thermal protection status.

STSR, STSL = 0	Detect thermal protection
STSR, STSL = 1	Not detect thermal protection

ALV[5:0]: Gain Control for PG3 (R-Channel ADC Analog Input)

ARV[5:0]: Gain Control for PG4 (L-Channel ADC Analog Input)

Default value: 00

PG3 and PG4 can be independently controlled for ADC input from 30 dB to −12 dB in 1-dB steps. The ADC output may have zipper noise while changing the level. In the PCM3793/94, the noise can be reduced when making the change by using zero-cross detection (register 85, ZCRS).

Table 11. Gain Level Setting

IDX[6:0]: 101 0001b (51h): Register 81

HPF[1:0]: High-Pass Filter Selection

Default value: 00

PCM3793/94 has digital high-pass filter to remove dc voltage at the input of the ADC. The cutoff frequency of the high-pass filter can be selected.

HPF [1:0]	High-Pass Filter Selection
0 0	f_C = 4 Hz at 48 kHz (default)
0 1	f_C = 240 Hz at 48 kHz
1 0	Reserved
1 1	High-pass filter disabled

RMUL: Digital Soft Mute Control for L-Channel ADC

RMUR: Digital Soft Mute Control for R-Channel ADC

Default value: 1

The digital output of the ADC can be independently muted or unmuted. The transition from the current volume level to mute, or the return to the previous volume setting from mute, occurs at the rate of one 1-dB step for each $8/f_S$ time period. When PMUL and PMUR = 0, the digital data is increased from mute to the previous attenuation level, and when PMUL and PMUR = 1, the digital data is decreased from the current attenuation level to mute. In the PCM3793/94, audible zipper noise can be reduced by using zero-cross detection (register 85, ZCRS).

RMUL, RMUR = 0	Mute disabled
RMUL, RMUR = 1	Mute enabled (default)

DSMC: Waiting Time for ADC Mute Off at Power Up

Default value: 0

The ADC digital output has an optional delay after power up when DSMC = 0. It is recommended to set DSMC = 0.

DSMC = 0	10 ms at 48 kHz (default)
DSMC = 1	No delay

RFM[1:0]: Audio Interface Selection for ADC (Digital Output)

Default value: 00

The audio interface for the ADC digital input supports I^2S, right-justified, left-justified, and DSP formats.

RFM [1:0]	Audio Interface Selection for ADC Digital Output
0 0	I^2S format (default)
0 1	Right-justified format
1 0	Left-justified format
1 1	DSP format

PAIR: Power Up/Down for PG2 and PG6 (Gain Amplifier for R-Channel Analog Input)

PAIL: Power Up/Down for PG1 and PG5 (Gain Amplifier for L-Channel Analog Input)

Default value: 0

This bit is used to control power up/down for PG2 and PG6 (gain amplifier for analog input).

PAIR, PAIL = 0	Power down (default)
PAIR, PAIL = 1	Power up

PADS: Power Up/Down for D2S (Differential Amplifier) of AIN1L and AIN1R

Default value: 0

This bit is used to control power up/down for D2S (differential-to-single amplifier).

PADS = 0	Power down (default)
PADS = 1	Power up

PMCB: Power Up/Down Control for Microphone Bias Source

Default value: 0

This bit is used to control power up/down for the microphone bias source.

PMCB = 0	Power down (default)
PMCB = 1	Power up

PADR: Power Up/Down Control for ADR (ADC and R-Channel Digital Filter)

PADL: Power Up/Down Control for ADL (ADC and L-Channel Digital Filter)

Default value: 0

This bit is used to control power up/down for the ADC and decimation filter.

PADR, PADL = 0	Power down (default)
PADR, PADL = 1	Power up

RALC: Automatic Level Control (ALC) Enable for Recording

Default value: 0

Automatic level control can be enabled with some parameters for microphone input or lower analog source level.

RALC = 0	Disable (default)
RALC = 1	Enable

RRTC: ALC Recovery Time Control for Recording

Default value: 0

This bit is used to select the recovery time for the ALC. The response is shown in Figure 36.

RRTC = 0	3.4 s (default)
RRTC = 1	13.6 s

RATC: ALC Attack Time Control for Recording

Default value: 0

This bit is used to select the attack time for the ALC. The response is shown in Figure 36.

RATC = 0	1 ms (default)
RATC = 1	2 ms

T0166-01

Figure 36. Attack and Recovery Time Response

RCP[1:0]: ALC Compression Level Control for Recording

Default value: 00

These bits are used to set the compression level for the ALC. The characteristic is shown in Figure 37.

RCP[1:0]	ALC Compression Level Control for Recording
0 0	−2 dB (default)
0 1	−6 dB
1 0	−12 dB
1 1	Reserved

RLV[1:0]: ALC Expansion Level Control for Recording

Default value: 00

These bits are used to set the expansion level for the ALC. The characteristic is shown in Figure 37.

MSTR: Master or Slave Selection for Audio Interface

Default value: 0

This bit is used to select either master or slave mode for the audio interface. In master mode, the PCM3793/94 generates LRCK and BCK from the system clock. In slave mode, it receives LRCK and BCK from another device.

MSTR = 0	Slave interface (default)
MSTR = 1	Master interface

BIT0: Bit Length Selection for Audio Interface

Default value: 1

This bit is used to select the data bit length for DAC input.

BIT0 = 0	Reserved
BIT0 = 1	16 bits (default)

SRST: System Reset

Default value: 0

This bit is used to enable system reset. All circuits are reset by setting SRST = 1. After completing the reset sequence, SRST is set to 0 automatically.

SRST = 0	Reset disabled (default)
SRST = 1	Reset enabled

NPR[5:0]: System Clock Rate Selection

Default value: 000000

MSR[2:0]: System Clock Dividing Rate Selection in Master Mode (Register 70)

Default value: 000

These bits are used to select the system clock rate and the dividing rate of the input system clock. See Table 12 for the details.

SLES193C–AUGUST 2006–REVISED FEBRUARY 2007

MBST: BCK Output Configuration in Master Mode

Default value: 0

This bit is used to control the BCK output configuration in master mode. In master mode, this bit sets the BCK output configuration to normal mode or burst mode. In normal mode (MBST = 0), the BCK clock runs continuously. In burst mode (MBST = 1), the BCK clock runs intermittently, and the number of clock cycles per LRCK period is reduced to equal the number of bits of audio data being transmitted. Operating in burst mode reduces the power consumption of V_{IO} (I/O cell power supply). This is effective in master mode (register 69 MSTR = 1).

MBST = 0	Normal output (default)
MBST = 1	Burst output

ATOD: ADC Digital Output to DAC Digital Input (Loopback)

Default value: 0

The ADC digital output is internally connected to the DAC digital input by setting ATOD = 1. This setting can be used to debug ADC functions or to monitor a recording.

ATOD= 0	Disabled (default)
ATOD= 1	Enabled

ZCRS: Zero-Cross for Digital Attenuation/Mute and Analog Gain Setting

Default value: 0

This bit is used to enablethe zero-cross detector, which reduces zipper noise while the digital soft mute, digital attenuation analog gain setting, or analog volume setting is being changed. If no zero-cross data is input for a $512/f_S$ period (10.6 ms at a 48-kHz sampling rate), then a time-out occurs and the PCM3793/94 starts changing the attenuation, gain, or volume level. The zero-cross detector cannot be used with continuous-zero and dc data.

ZCRS = 0	Zero cross disabled (default)
ZCRS = 1	Zero cross enabled

AD2S: Differential Amplifier Selector (MUX3 and MUX4)

Default value: 0

The PCM3793/94 has stereo single-input amplifiers (PG1, PG2) and a monaural differential-input amplifier (D2S) which can be used as ADC inputs. MUX3 and MUX4 can be selected as the monaural differential input by setting AD2S = 1.

AD2S = 0	Single-input amplifiers (default)
AD2S = 1	Differential-input amplifier

AIL[1:0]: AIN1L, AIN2L, and AIN3L Selector (MUX1)

Default value: 00

This bit is used to select one of the three analog inputs, AIN1L, AIN2L, or AIN3L.

AIL[1:0]	AIN L-channel Select
0 0	Disconnect (default)
0 1	AIN1L
1 0	AIN2L
1 1	AIN3L

AIR[1:0]: AIN1R, AIN2R, and AIN3R Selector (MUX2)

Default value: 00

This bit is used to select one of the three stereo analog inputs, AIN1R, AIN2R, or AIN3R.

AIR[1:0]	AIN R-channel Select
0 0	Disconnect (default)
0 1	AIN1R
1 0	AIN2R
1 1	AIN3R

IDX[6:0]: 101 1111b (5Fh): Register 95

SDAS: Source Select for Sound Effect (Tone Control, 3-D Sound, Notch Filter, Mono Mix)

Default value: 0

The PCM3793/94 includes sound effect circuits (tone control, 3-D sound, notch filter, mono mix) which can be used to filter either the digital input to the DAC or the digital output from the ADC. This bit selects the signal source of the sound effect circuit.

SDAS = 0	DAC digital input (default)
SDAS = 1	ADC digital output

3DEN: 3-D Sound Effect Enable

Default value: 0

This bit is used for enabling the 3-D sound effect filter. This filter has two independently controlled parameters.

3DEN = 0	Disable (default)
3DEN = 1	Enable

3FL0: Filter Selection for 3-D Sound

Default value: 0

This bit is used for selecting fron two kinds of filter type, narrow and wide. These filters have a different 3-D effect performance.

3FL0 = 0	Narrow (default)
3FL0 = 1	Wide

3DP[3:0]: Efficiency for 3-D Sound Effects

Default value: 0000

These bits are used for adjusting the 3-D sound efficiency. Higher percentages have greater efficiency.

3DP[3:0]	3D Sound Effect Efficiency
0 0 0 0	0% (default)
0 0 0 1	10%

IDX[6:0]: 110 0000b (60h): Register 96

NEN2: Second-Stage Notch Filter Enable

Default value: 0

PCM3793/94 has two notch filters with characteristics that can be set separately. This bit is used to enable the second stage.

NEN2 = 0	Disable (default)
NEN2 = 1	Enable

NEN1: First-Stage Notch Filter Enable

Default value: 0

PCM3793/94 has two notch filters with characteristics that can be set separately. This bit is used to enable the first stage.

NEN1 = 0	Disable (default)
NEN1 = 1	Enable

NUP2: Second-Stage Notch Filter Coefficients Update

Default value: 0

This bit is used to update the coefficients for 2nd stage notch filter. The coefficients written to registers 101, 102, 103, and 104 are updated when NUP2 = 1.

NUP2 = 0	No Update (default)
NUP2 = 1	Update (set to 0 automatically after set to 1)

NUP1: First-Stage Notch Filter Coefficients Update

Default value: 0

This bit is used to update the coefficients for the second-stage notch filter. The coefficients written to registers 97, 98, 99, and 100 are updated when NUP1 = 1.

NUP1 = 0	No Update (default)
NUP1 = 1	Update (set to 0 automatically after set to 1)

MXEN: Digital Monaural Mixing

Default value: 0

This bit is used to enable or disable monaural mixing in the section that combines L-ch data and R-ch data.

MXEN = 0	Stereo (default)
MXEN = 1	Monaural Mixing

S[107:100]: Lower 8 bits of Coefficient a_1 for Second-Stage Notch Filter

S[115:108]: Upper 8 bits of Coefficient a_1 for Second-Stage Notch Filter

S[207:200]: Lower 8 bits of Coefficient a_2 for Second-Stage Notch Filter

S[215:208]: Upper 8 bits of Coefficient a_2 for Second-Stage Notch Filter

Default value: 00000000

These bits are used to change the characteristics of the second-stage notch filter. See Figure 38 for details.

The PCM3793/94 provides two notch filters for the digital input to the DAC or the digital output from the ADC. The optional filter characteristics of each filter are programmable. The characteristics are given by calculating the coefficients for three parameters, sampling frequency, center frequency, and bandwidth, as shown in Figure 38. All coefficients must be written as 2s-complement binary data into registers 97, 98, 99, 100, 101, 102, 103, and 104.

f_S: Sampling Frequency [Hz]
f_C: Center Frequency [Hz]
f_b: Band Width [Hz]

$$a_1 = -(1 + a_2) \cos\left(\frac{2\pi f_C}{f_S}\right) \quad \text{(Equation 1)}$$

$$a_2 = \frac{1 - \tan\left(\frac{2\pi f_b/f_S}{2}\right)}{1 + \tan\left(\frac{2\pi f_b/f_S}{2}\right)} \quad \text{(Equation 2)}$$
M0058-01

Figure 38. Parameter Settings for Notch Filter

The coefficients are calculated using Equation 1 and Equation 2 in Figure 38. An example follows:
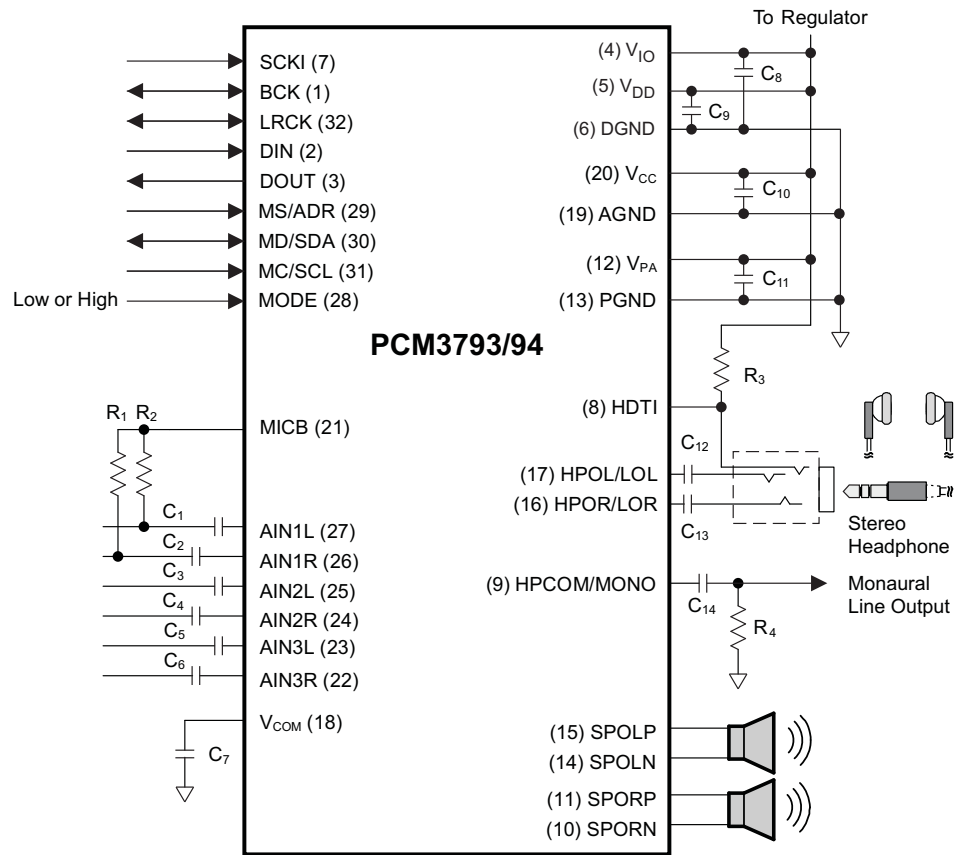

f_S = 16 kHz, f_C = 0.5 kHz, f_b = 0.2 kHz
a_2 = 0.924390492 → Decimal to Hex → 3B29h
a_1 = −1.887413868 → Decimal to Hex → 8735h
a_2: F[215:208] = 3Bh, F[207:200] = 29h
a_1: F[115:108] = 87h, F[107:100] = 35h

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Only one of markings shown within the brackets will appear on the physical device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

          F.   Falls within JEDEC MO−220.

RHB (S−PVQFN−N32)   PLASTIC QUAD FLATPACK NO−LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No−Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTES: A. All linear dimensions are in millimeters.
         B. This drawing is subject to change without notice.
         C. Publication IPC−7351 is recommended for alternate designs.
         D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat−Pack
             Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets
             for specific thermal information, via requirements, and recommended board layout. These documents are available at
             www.ti.com <http://www.ti.com>.
         E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should
             contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
         F. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting
             recommendations for vias placed in the thermal pad.

TEXAS INSTRUMENTS

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:
- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits,General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:
- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
