## RECOMMENDED PCB DESIGN

PCB SIZE=30.0x22.5mm

PCB: FR-4, t=0.5mm

STRIPLINE WIDTH=1mm

CAPACITORS: size 1005

### Precautions

- [1] External capacitors should be connected to the input and output RF terminals (P1, P2, PC) to block the DC current. The values of these capacitors depend on RF frequency range. Please use a 0.01uF capacitor at 50 to 100MHz, a 0.1uF capacitor at 100 to 500MHz, and a 56pF capacitor at 500MHz to 2GHz.
- [2] Decoupling capacitors should be connected to the control terminals ( $V_{CTR1}$ ,  $V_{CTR2}$ ) as close as possible. The values of these capacitors should be selected to 0.01uF at 50 to 100MHz, 0.1uF at 100 to 500MHz, and 10pF at 500MHz to 2GHz. Please take care to select these values because the capacitors make switching time long.
- [3] In order to keep good isolation characteristics, the ground terminals (3, 6, 7 pin) should be connected to ground pattern with wider width as close as possible, and through-hole in the ground plane should also be placed as close as possible.
- [4] The isolation of PC port to P1 port is greater than the isolation of PC port to P2 port. Please consider this information to create better isolation design.
